All the themes in the Plan are listed by fields of research. Each theme is coded according to the JINR system of classification and contains the following information:

- the first number * - the field of research
- the second number ** - the conventional number of Laboratory or other Division of JINR
- the third number - the theme's ordinal number
- the fourth and the fifth numbers - the years of the activity's beginning and completion

<ul style="list-style-type: none"> * 01 - Theoretical Physics 02 - Elementary Particle Physics and Relativistic Nuclear Physics 03 - Nuclear Physics 04 - Condensed Matter Physics and Radiobiological Research 05 - Networking, Computing, Computational Physics 06 - Educational Programme 	<ul style="list-style-type: none"> ** 0 - All-Institute Topics 1 - Veksler and Baldin Laboratory of High Energy Physics (VBLHEP) 2 - Dzhelapov Laboratory of Nuclear Problems (DLNP) 3 - Bogoliubov Laboratory of Theoretical Physics (BLTP) 4 - Frank Laboratory of Neutron Physics (FLNP) 5 - Flerov Laboratory of Nuclear Reactions (FLNR) 6 - Laboratory of Information Technologies (LIT) 8 - Science Organization Department (SOD) 9 - Laboratory of Radiation Biology (LRB)

Theory of Fundamental Interactions

Leaders:

D.I. Kazakov
O.V. Teryaev
A.B. Arbuzov

Participating Countries and International Organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, Canada, CERN, China, Czech Republic, Finland, France, Georgia, Germany, Hungary, ICTP, Italy, Japan, Kazakhstan, Mexico, Mongolia, New Zealand, Norway, Poland, Republic of Korea, Russia, Serbia, Slovakia, Spain, Sweden, Switzerland, USA, Ukraine, United Kingdom, Uzbekistan, Vietnam.

Scientific Programme

The main aim of the research within the theme is the construction of theoretical models and their application to the description of properties of elementary particles and their interactions. This research includes the following directions of activity. The development of quantum field theory formalism in gauge and supersymmetric theories. Construction and investigation of the models of particle physics beyond the Standard Model. Theoretical support of experiments at the Large Hadron Collider on the search of new physics and the study of the properties of the Higgs boson. Calculation of radiative corrections to the processes of particle creation within the Standard Model and its extensions. Investigation of neutrino properties and neutrino oscillations. Investigation of the hadron properties within quantum chromodynamics and phenomenological quark models. Study of the hadron spin structure with the help of generalized and transverse momentum dependent parton distributions. Study of heavy quark properties and exotic hadrons. Lattice simulations for obtaining nonperturbative results in gauge theories. Investigation of dense hadronic matter and theoretical support of the program NICA. Theoretical support of a wide range of current and future experiments at JINR, IHEP, CERN, GSI, DESY and other physics centers.

Expected main results in 2017:

- Calculation of ultraviolet divergences in maximally supersymmetric gauge theories in extra dimensions in all orders of perturbation theory.
Theoretical analysis of SUSY searches at LHC in the framework of the MSSM and the NMSSM based on experimental data from ATLAS and CMS.
Investigation of the effects due to radiative corrections in Drell-Yan processes after increasing LHC luminosity and beam energy.
Studies of Q^2 -evolution of the average gluon and quark jet multiplicities with the double-logarithm resummation taken into account.
Investigation of high-energy asymptotics of the structure function F_2 and its heavy quark parts.
Development of the method of incorporation of strong corrections in to physical observables at an arbitrary order of QCD perturbation theory within the dispersive approach.
Development of a twistor description for form factors and off-shell amplitudes in theories with extended supersymmetry.
Study and calculation of anomalous dimensions of twist 2 operators in the case of ABJM and orbifold deformations of N=4 SYM within the quantum spectral curve approach.
Studies of the dark matter problem in the framework of the Standard Model and beyond it, including its supersymmetric generalizations. Building of Minimal Consistent Dark Matter models. Development of the strategy of comparing/mapping of their parameters for results of searches.

- Extraction of non-OPE QCD short string contributions to annihilation and decay processes using the standard and IR-modified couplings.
Account for strange quark mass effects in the anomaly sum rules in space-like and time-like regions.
Calculations for different mechanisms of exclusive Drell-Yan pairs production from NICA to LHC energies.
Lattice calculations of transverse-momentum dependent distributions and hadron polarizabilities.
Development of a complementary scheme of processing of low x data for spin-dependent structure functions based on truncated moments used.
- Calculation of the hadronic light-by-light contributions to the muon anomalous magnetic moment in the leading and next-to-leading orders in the $1/N_c$ parameter.
Investigation of meson creation at low energies at electron-positron beams.
Calculations of widths of tau decays.
Calculation of the contribution of anomalous quark-gluon chromomagnetic interaction to the single- and double- spin asymmetries for inclusive pion production in high energy proton-proton collisions.
The glueball/Hybrid spectrum of the Hamiltonian of Dirac-Yang-Mills quantum mechanics of spatially constant fields, which constitutes to the lowest leading order in strong coupling, will be calculated with high precision for both the baby version of SU2 and the real case of SU3, using a systematic variational approach based on an orthonormal basis of trial states which are the exact analytical solutions of the corresponding harmonic oscillator problem.
- Participation (continuation) in the tmfT Collaboration (finite temperature with twisted mass fermions) aimed at description of the quark-gluon thermodynamics including strange and charmed quarks and consideration of new observables indicating the crossover.
Study of the phenomenology of topological defects (Z(3) walls and associated strings) with metastable Z(3) domains based on lattice QCD calculations.
Investigation of the contribution of topological degrees of freedom (monopoles, dyons, vortices) to the properties of strongly interacting quark-gluon plasma.
Investigation of the influence of the glueballs to the properties of sQGP above the deconfinement temperature in hot/dense nuclear matter.
Study of the generation of vorticity in heavy-ion collisions and its effect on P-odd correlations of quarks and mesons in the NICA energy range.
Investigation of the role of color degrees of freedom at the early stage of heavy-ion interactions within the model of Parton Hadron String Dynamics (PHSD), estimation of the intensity of chromoelectric and chromomagnetic fields created in collisions of relativistic heavy ions.
Investigation of observable manifestations of the nonperturbative gluon fields (domain walls and nontopological solitons) in the collisions of relativistic heavy ions. Study of the influence of electromagnetic fields on the formation of a heterophase mixed phase within the domain model of the QCD vacuum.
The THESEUS programme will be used to generate events at NICA energies. The research will concern mainly the study of the new EoS and transport coefficients. Study of hybrid EoS (equations of state) based on ab-initio nuclear EoS and non-local PNJL models in a wide range of densities, temperatures and isospin asymmetry, applications in the simulation of heavy-ion collisions and supernova collapse and in compact star phenomenology.

Theory of Nuclear Structure and Nuclear Reactions

Leaders:

V.V. Voronov
A.I. Vdovin
N.V. Antonenko

Participating Countries and International Organizations:

Armenia, Austria, Belarus, Belgium, Brazil, Bulgaria, Canada, China, Czech Republic, Egypt, France, Germany, Greece, Hungary, Italy, Japan, Kazakhstan, Moldova, Norway, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, South Africa, Spain, Sweden, Switzerland, Taiwan, Ukraine, USA, Uzbekistan.

Scientific Programme

The main goals are to predict and analyze properties of atomic nuclei beyond the stability valley and investigate structure peculiarities of superheavy and exotic nuclei; to study dynamics of nuclear collisions at low and intermediate energies accompanied by production of stable as well as radioactive nuclides; to investigate fundamental properties of various few-body systems and develop rigorous and effective mathematical methods of calculations of their properties; to explore the dynamics of particle-nucleus and nucleus-nucleus collisions at relativistic energies and nuclear matter properties and its phase transitions at extreme values of temperature and density.

Expected main results in 2017:

- Investigation of the impact of the phonon-phonon coupling on the beta-delayed multi-neutron emission of neutron-rich nuclei.
 - Study of the effects of the quasiparticle-phonon interaction on the E1-strength in neutron-rich Ca isotopes.
 - Analysis of the influence of the fourth order Wigner function moments on the energies and excitation probabilities of nuclear collective states.
 - Elaboration of the effective method to study the impact of deformation on the beta-decay half-lives and delayed multi-neutron emission probabilities.
 - Study of the possibility to identify the toroidal E1 resonance for the anomalous deformation splitting.
- Calculations of the energies of the lowest quadrupole states of the even-even superheavy nuclei applying the Grodzins relation.
 - Determination of the probability to observe the collinear separation of true ternary fission fragments at spontaneous fission of ^{252}Cf and in the $^{235}\text{U}(n,f)$ reaction.
 - Assessment of the prospects of the SHE production in charged particle evaporation channels.
 - Theoretical search for fissionable actinide isotopes, in which the charge distribution of the fission products remains asymmetrical even at a rather high excitation energy.
 - Evaluation of the probabilities to product new actinide isotopes in the multi-nucleon transfer reactions and the search most efficient reactions to this end.
 - Calculation the probability to synthesize new actinide isotopes in the multi-nucleon transfer reactions aiming to determine the most effective reactions for their production.
 - Application of the non-Markovian Langevin approach to study the dynamics of fermionic (bosonic) subsystem, linearly coupled to the fermionic (bosonic) environment.
- Determination of conditions for emerging the confinement-induced resonances in hybrid atom-ion systems.
 - Determination of the solvability conditions for the operator Riccati equation associated with a 2×2 -block-matrix Hamiltonian in the three-gap spectral case.
 - Development of a dynamic approach to the study of the ionization processes in atomic collisions.

Calculation of binding energies and scattering observables as well as the study of the Efimov properties of van-der Waals clusters LiHe_2 applying the hard-core differential Faddeev equations.

Study of the Coulomb breakup of exotic nuclei in the non-stationary quantum-mechanical approach.

Calculation of electron scattering off hydrogen molecule and hydrogen molecular ion in the kinematic regime of laser-assisted electron momentum spectroscopy.

- Calculations of excitation functions for the first three cumulants of hadronic distributions within the PHSD model for relativistic Au+Au collisions including the NICA energy and aiming to search for signals of a possible quark-hadron phase transition.

Study of the properties of nuclear interactions in the presence of strong electromagnetic fields under conditions of violation of the CP invariance of strong interactions. The behavior of masses and couplings for quarks, diquarks and mesons will be studied at finite temperature and density.

Investigation of non-linear quantum processes in strong linearly-polarized electromagnetic fields and subsequent generalization of the theory to the electromagnetic fields induced in relativistic heavy-ion collisions.

Elaboration of the theoretical approach to analyse open charm production in a pion and anti-proton induced reaction and investigation of the structure of charmed resonances.

Development of the folding model of a meson-nuclear potential and analysis of the corresponding experimental data.

Theory of Condensed Matter

Leaders:

V.A. Osipov
A.M. Povolotskii

Participating Countries and International Organizations:

Armenia, Australia, Austria, Belarus, Belgium, Brazil, Bulgaria, Canada, Czech Republic, France, Germany, Hungary, India, Ireland, Italy, Japan, Moldova, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, Slovenia, Spain, Switzerland, Taiwan, Ukraine, USA, Uzbekistan, Vietnam.

Scientific Programme

Effects of strong electron correlations in high-temperature superconductors, colossal magneto-resistance compounds (manganites), heavy-fermion systems, low-dimensional quantum magnets with strong spin-orbit interaction, topological insulators, etc. will be investigated based on a variety of underlying many-band electronic models including the extended Hubbard model, Anderson model, super-exchange spin-orbital models of transition of metal oxides with strong relativistic spin-orbital coupling. The electronic band structure, spectral properties of charge carrier quasiparticles, magnetic and charge collective excitations, metal-insulator and magnetic phase transitions, Cu- and Fe-based high-Tc superconductivity, charge and spin-orbital ordering will be studied. The obtained results will be used to support neutron scattering experiments performed at FLNP, JINR.

Investigations in the field of nanostructures and nanoscaled phenomena will be addressed to a study of physical characteristics of nanomaterials promising for various applications in modern nanotechnologies. The electronic, thermal and transport properties of carbon nanostructures will be investigated. It is planned to study the problem of quantum transport in molecular devices. Spin dynamics of magnetic nanoclusters will be investigated. The analysis of resonance tunneling phenomena in the layered superconductors and superconducting nanostructures in the external fields will be performed. Numerical modeling of resonance, radiative and chaotic properties of intrinsic Josephson junctions in high temperature superconductors is planned to be carried out.

Models in condensed matter physics will be studied by using methods of equilibrium and non-equilibrium statistical mechanics with the aim of revealing general properties of many-particle systems based on the ideas of self-similarity and universality. Mathematical mechanisms, underlying the kinetic and stationary behavior of model systems, as well as possible links between different models, will be investigated. The study of two-dimensional lattice models by the transfer matrix method will be focused on confirming the predictions of the logarithmic conformal field theory. The theory of integrable systems will be developed in the aspect of finding new integrable boundary conditions for two-dimensional spin systems and the solution of the corresponding Yang-Baxter equations. The universal behavior of correlation functions in non-equilibrium systems will be studied as well. The research in the structure theory and the theory of representations of quantum groups and matrix algebras will be directed to further applications in the theory of integrable models in quantum mechanics and statistical physics. Applications of the elliptic hypergeometric integrals, defining the most general solutions of the Yang-Baxter equation and most complicated known exactly computable path integrals in four-dimensional quantum field theory, to two-dimensional spin systems will be studied.

Expected main results in 2017:

- Theoretical study of electronic and magnetic properties of strongly correlated systems including newly synthesized oxides 3d, 4d and 5d transition metals.

Theoretical study of electronic, transport and optical properties of hybrid perovskites for the third generation of solar cells.

Calculation of the spin-wave excitation spectrum, magnetization, susceptibility and the Neel temperature for the quasi-two-dimensional Kitaev-Heisenberg model on the honeycomb lattice proposed for iridates in the antiferromagnetic and paramagnetic states.

Development of the superconducting theory for the quasi-two-dimensional compass- Heisenberg model and the Kitaev-Heisenberg model on the honeycomb lattice.

Investigation of the one-dimensional Bose gas in external potentials. Description of short-range correlations in the Bose gas in the regime of strong interactions.

Development of theoretical models for small-angle scattering from mass and surface fractals. Theoretical study of small-angle scattering from multifractals.

Investigation of generation of magnetic precession by Josephson current in the presence of spin-orbital coupling in the external electromagnetic field. The classification of the appearing superconducting spintronics effects.

Study of the hopping mechanism of the vibron excitation transport in macromolecular chains in the framework of non-adiabatic polaron theory depending on the quantum state of the macromolecular structural elements, such as squeezed and chaotic squeezed states.

Theoretical investigation of the electron conductivity in polycrystalline graphene. Calculation of a relaxation time due to a finite charged dislocation wall of a different type (grain boundary scattering), and the corresponding contribution to the tensor of conductivity as a function of temperature and carriers concentration.

Application of the extended self-consistent Huckkel method, along with the non-equilibrium Green's function method and finding of the current-voltage characteristics of some graphene nanostructures. Investigation of the influence of the phonon-phonon interaction to the thermal conductance of the graphene nanoribbons with a different width.

Development of the new concepts of electronic nano-devices based on graphene and graphene ribbons. Investigation of different aspects of electron transport in the electronic devices based on the graphene edge states.

Within the dual model of strongly correlated electrons, the spin correlation function is to be computed for the lightly doped cuprates beyond the mean-field approximation.

- Construction of superconformal indices for quiver supersymmetric gauge theories and description of their relation to partition functions of lattice spin systems.

Consideration of a traffic model, where a condition of irreversible aggregation is introduced along with the standard conditions of the excluded volume. Irreversible aggregation means that a cluster of particles being emerged once will not be destroyed later and all particles of the cluster move synchronously. The model is defined on a finite interval with a given ingoing and outgoing probabilities α , β at the ends of interval. The phase diagram of the stationary state will be constructed and its peculiarities in four different sectors will be explained.

Detailed investigation of the rotor-router aggregation model on infinite graphs.

Investigation of separation of variables in three-body elliptic Calogero-Moser systems.

Computation of large-deviation probabilities in the spherical model, generalized spherical model and in the models of the Boson gas.

Investigation of the structure of quantum matrix algebras of orthogonal and symplectic types, classification of irreducible representations of the braid group B_3 in low dimensions.

Solving of spectral problems in systems of mixed dimensionality. Derivation of new characteristics of the equiangular tight frames.

Description of the transition from the Kardar-Parisi-Zhang regime to the deterministic aggregation regime in the non-stationary fluctuations of particle current in the model of generalized asymmetric simple exclusion process. Calculation of the universal finite size corrections to the large deviation function of particle current in the model of random walks in a random environment.

Development of the theory of Bose-condensed systems with dipolar interaction potentials.

Formulation of an approach for describing non-equilibrium networks of complex quantum systems.

Study of the time evolution and stationary states of open many-particle interacting systems by means of a special procedure of a reduced description. The method of maximum information entropy will be analyzed in this context.

Construction of solutions of the Yang-Mills equations on conical spaces with Lorentzian metric in various dimensions. Study of the particle-vortex duality.

Modern Mathematical Physics: Strings and Gravity, Supersymmetry, Integrability

Leaders: A.P. Isaev
A.S. Sorin
Deputy: S.O. Krivonos
Scientific leader: A.T. Filippov

Participating Countries and International Organizations:

Australia, Austria, Armenia, Belarus, Brazil, Bulgaria, Canada, CERN, Czech Republic, France, Germany, Greece, Hungary, ICTP, India, Italy, Japan, Norway, Poland, Romania, Russia, Serbia, Spain, Turkey, Ukraine, United Kingdom, USA.

Scientific Programme

The main purpose of research in modern mathematical physics is the development of mathematical methods for solving the most important problems of modern theoretical physics: clarifying the nature of fundamental interactions and their symmetries, construction and study of effective field models arising in the theory of strings and other extended objects, uncovering the geometric description of quantum symmetries and their spontaneous breaking in the framework of search for a unified theory of all fundamental interactions, including quantum gravity. Mathematical physics in recent years has been characterized by increasing interest in identifying and effective use of integrability in various areas, and in applying powerful mathematical methods of quantum groups, supersymmetry and non-commutative geometry to quantum theories of fundamental interactions as well as to classical models.

The main goals and tasks of the research within the theme include: development of new mathematical methods for description of a variety of integrable models and their exact classical and quantum solutions; analysis of a wide range of problems in the theory of superstrings and superbranes, including study of nonperturbative regimes in supersymmetric gauge theories; development of a microscopic description of black holes and constructing cosmological models of the early Universe. The decisive factor to solve the above problems is a crucial use of the mathematical methods of the theory of integrable systems, quantum groups and noncommutative geometry as well as superspace techniques.

Expected main results in 2017:

- Construction of supergravity backgrounds which describe intersecting D-(M)-brane solutions with Lifshitz-like asymptotics. Analysis of the obtained solutions in the framework of the gauge/gravity duality. Investigation of correlation functions between a Wilson loop and local photons in the obtained backgrounds using the holographic approach.

Construction and analysis of solutions without a horizon (boson stars) with Lifshitz-like asymptotics. Construction of Kerr-Vaidya/ Kerr-Newman-Vaidya solutions with AdS asymptotics for D=5 supergravity model. Study of local operators (two-point correlation functions) for the constructed metrics via holography.

Study of systems with one-half spontaneously broken supersymmetry and construction of the component action for the Born-Infeld theory with N=4, d=4 supersymmetry, with N=2 vector multiplet as Goldstone superfield.

Construction of the supersymmetric extensions of the mechanics, including the Pais-Uhlenbeck oscillator with specific frequencies, which are invariant with respect to the l-conformal Galilei group or its deformations.

Calculation of the monodromy matrix elements action onto universal Bethe vectors in the quantum integrable models associated with supersymmetric extension of the Yangian double. Application of these formulas for obtaining a supersymmetric analog of the Reshetikhin's formula for the scalar products of the Bethe vectors in the supersymmetric models.

Study of the universal Bethe vectors for the quantum integrable models associated with $gl(4)$ and $gl(2,2)$ spin chains. Study of the representations of connected Yangians with the aim to obtain the correlation functions in quantum integrable models.

In the framework of special Bohr–Sommerfeld geometry, applications to the case when the phase space is not simply connected will be studied. Investigation of a relation between special Bohr–Sommerfeld geometry and the Hitchin integrable systems in the simplest case of riemannian surfaces of genus > 1 .

Construction of moduli spaces of special Bohr–Sommerfeld cycles in the algebraic case. It will be shown that in the algebraic case these moduli spaces are finite dimensional.

- The $N = (1; 1)$; 6D SYM superfield invariants including the candidate counterterms found earlier from the pure symmetry considerations will be reproduced from the full-fledged quantum perturbation theory in $N = (1; 1)$ and $N = (1; 0)$ harmonic superspaces. The background field method for $N = (1; 1)$; 6D SYM theory will be developed in full generality.

Construction and study of the $SU(2|1)$ and $SU(2|2)$ invariant extensions of the Calogero-Moser models as deformations of $N = 4$ supersymmetric extensions.

The models of $N = 4$ supersymmetric quantum mechanics with “long multiplets”, as well as their $SU(2|1)$ deformations, will be thoroughly studied, their bosonic target geometry will be revealed and quantum spectrum will be found for a few particular cases.

The study of 6D supergravity models in the off-shell $N = (1; 0)$ and on-shell $N = (1; 1)$ 6D harmonic superspaces will be started. The constraints of $N = (1; 1)$ 6D supergravity will be solved in terms of $N = (1; 0)$ superfields.

Construction of superfield action for the many-particle systems with $N=4$ deformed supersymmetry. Superfield formulation of sigma model with Wess-Zumino term possessing the $N=4$ deformed supersymmetry and describing the interaction of the spinning particle with an external gauge background.

Construction of models for spinning particles and superparticles using momentum twistors. Obtaining of transition amplitudes from the BFV–BRST path integral.

Definition of geometries described by $N=4$ supersymmetric quantum mechanical sigma models with a variety of dynamical, semi-dynamical and gauge supermultiplets. Determination of the type of supercharges for different geometries.

Construction of new hairy black holes linked to charged scalar clouds in the Kerr-Newman space-time. Investigation of the near BPS spinning self-gravitating Skyrmons. Construction of spinning black holes with the BPS Skyrme hair.

- Observations of bright stars near the Galactic Center will be used for obtaining constraints on modification of the Newton gravity law in the weak field approximation. The bounds on a graviton mass will be obtained also proceeding from a potential reconstruction at the Galactic Center.

Realistic inflation scenarios consistent with observational data from Plank-2015 will be developed by making use of the classical Yang-Mills fields non-minimally coupled to gravity.

Description of the scalar-tensor perturbations in modified theories of gravity without the Einstein frame; in particular, in theories with an arbitrary function of the torsion scalar.

The stability of modified gravity theories with higher derivatives will be studied regarding different perturbations.

The explicit compact formulae are expected to be derived for the forces exerted on the material medium by the electromagnetic field, taking advantage of the different forms for the relevant energy-momentum tensor.

Derivation of the vacuum energy of quantized fields in the presence of crossed cosmic strings and extraction of its finite part depending on the strings’ mutual position.

Study of the vacuum fluctuations on the lattice background formed by multi-dimensional delta functions.

Construction of integrable scalar cosmologies with a cubic integral of motion.

Dubna International Advanced School of Theoretical Physics (DIAS-TH)

Leaders:

A.S. Sorin
V.V. Voronov

Participating Countries and International Organizations:

Austria, Brazil, Bulgaria, Canada, CERN, Czech Republic, France, Germany, Greece, Hungary, India, Israel, Italy, Japan, Mexico, Poland, Romania, RSA, Russia, Serbia, Turkey, Ukraine, United Kingdom, USA, Vietnam.

The Bogoliubov Laboratory of Theoretical Physics (BLTP) has a good record of organizing international workshops and schools in Dubna. DIAS-TH organizes and supervises all educational programs for students, postgraduates, and young scientists at BLTP. It should function continuously and the standard short schools (about 3-4 a year) should be organized coherently. Other educational programs in Dubna such as the JINR University Center may also correlate with DIAS-TH (common programs on modern theoretical physics, workshops for students and young scientists, etc.).

The main goals of DIAS:

- Training courses for students, graduates, and young scientists in the JINR Member States and other countries (according to special agreements and grants).
- Looking for and supporting gifted young theorists in the JINR Member States; creating databases of students and young researchers.
- Organization of schools of different levels in Dubna and coordination with similar schools in Russia, Germany, and other European countries.
- Support of the JINR experimental programs by organizing lecture courses and review lectures on new trends in modern physics.
- Cooperation with the JINR University Center in training students and postgraduates as well as in organizing schools for students.
- Coordination of the research - training programs with workshops and conferences at JINR.
- Publication of lectures and discussions in different forms, in particular, with the use of modern electronic equipment, etc.
- Supporting the WEB page of DIAS-TH which should become the organizing center of the programs related to DIAS-TH.

The main topics of the DIAS activity should be centered around the most important directions of research at BLTP: Theory of Fundamental Interactions; Nuclear Theory; Theory of Condensed Matter; Modern Mathematical Physics.

Expected main results in 2017:

- Organization of three international schools at BLTP.
- Organization of one-day lectures/discussions and regular seminars for students and post-graduates.
- Computer processing of video records of lectures, support of digital archive of video records.
- Support of Web-site of DIAS-TH.

JINR's Participation at the BES-III Physics Research Program

Leader: A.S. Zhemchugov

Participating Countries and International Organizations:

China, Russia.

Scientific Programme

The BES-III experiment at the electron-positron collider BEPC (IHEP CAS, Beijing, China) is aimed at systematic and precise measurements in τ -charm domain. The main goals of the experiment include light hadron spectroscopy, study of charmonium spectrum and transitions, study of open charm particles like D and Ds mesons, τ -lepton physics and search for new exotic XYZ states. Data taking started in 2009. The world largest sample of J/ψ , $\psi(3686)$, $\psi(3770)$, $\psi(4040)$ is already collected. Scan in the energy range 2.0–4.6 GeV is performed for R-ratio measurement. Unique sample in the energy range 4.2–4.6 GeV is collected to search for new XYZ states.

Expected main results in 2017:

- BES-III data analysis.
- Development of offline software and analysis tools
- Development of the distributed computing system (integration of cloud resource).
- Development of high-performance PWA software using HybriLIT cluster.

 A.P. Cheplakov

Participating Countries and International Organizations:

Armenia, Azerbaijan, Belarus, Canada, CERN, Czech Republic, France, Germany, Georgia, Greece, Israel, Italy, Netherlands, Russia, Slovakia, Spain, USA, Uzbekistan.

Scientific Programme

Comprehensive investigations of superhigh-energy (7–14 TeV) proton scattering at the Large Hadron Collider with the ATLAS facility will yield utterly new and unique experimental data. Their analysis will allow solution to the most profound physical problems fundamentally important for world outlook.

JINR researchers will take part in solution of some of these problems within the project. Among the most important of them are the clarification of the origin of the elementary particle mass (Higgs mechanism) and search for and investigation of supersymmetry, which will allow an insight into the nature of galactic dark matter and the character of the evolution of our Universe. Other important problems are determination of the applicability boundaries of the modern standard model of elementary particles and observation of evidence for new physical phenomena, such as additional space dimensions or previously unknown particles and interactions. In addition, JINR researchers will get new results allowing more specific knowledge as to the properties of the already known elementary particles such as the W and Z bosons, the top quark, and others.

Implementation of this project aimed at solving highly important scientific problems will result in getting unique applied data.

The “by-products” worth noting are development, debugging, and experience in operation of systems for remote monitoring of highly complicated devices and development and practical use of the distributed computation system (grid) in a long-term, full-scale experiment.

Expected main results in 2017:

- Participation in the LHC and ATLAS detector maintenance and upgrades.
- Data development and analysis of the ATLAS data. The new physical results to be obtained in investigations of some key processes of the Standard Model, exotic physics, search for SUSY and heavy quarks physics.
- Development of the ATLAS physics programme: simulation of physical processes, participation in the ATLAS working group, etc.
- Work on the modernization project of the ATLAS detector, including the toroidal magnets, hadron calorimeters and muon spectrometer.
- Detector maintenance and operation.

Search for New Physics in Experiments with the Fermilab High-Intensity Muon Beams

Leader: V.V. Glagolev
Scientific leader: J.A. Budagov

Participating Countries and International Organizations:

Belarus, Bulgaria, Georgia, Italy, Russia, Slovakia, USA, Ukraine.

Scientific Programme

The muon anomalous magnetic moment a_μ can be measured and computed to high precision. The comparison between experiment and the SM therefore provides a sensitive search for New Physics (NP). At present, both measurement and theory have sub-part-per-million (ppm) uncertainties, and the “g-2 test” is being used to constrain SM extensions. The difference between experiment and theory, $\Delta a_\mu(\text{Expt} - \text{SM}) = (255 \pm 80) \times 10^{-11}$ ($3, 2\sigma$), is a highly cited result and a possible harbinger of new TeV-scale physics. Potential explanations of the deviation include: supersymmetry, lepton substructure, dark matter loop etc., all well motivated by theory and consistent with other experimental constraints. Fermilab experiment has a plan to reduce the experimental uncertainty by a factor of 4 or more. A precise g-2 test, no matter where the final value lands, will sharply discriminate among models and will enter as one of the central observables in a global analysis of any SM extensions.

The Mu2e experiment at Fermilab is a dedicated search for the CLFV process $\mu^- N \rightarrow e^- N$, which is the coherent conversion of a muon into an electron in the vicinity of a nucleus. Once neutrinos masses are included, the process is allowed but effectively still absent since the rate is proportional to $(\Delta m_{ij}^2/M_W^2)^2$, where Δm_{ij}^2 is the mass difference squared between i-th and j-th neutrino mass eigenstates, and M_W is the mass of the W-boson. The predicted rates for the $\mu^- N \rightarrow e^- N$ and $\mu^+ \rightarrow e^+ \gamma$ CLFV processes are less than 10^{-50} each. This makes this process a very theoretically clean place to search for NP effects. In many NP models that include a description of neutrino mass, the rates for these processes are enormously enhanced so that they occur at a level to which Mu2e experiment will have sensitivity.

Expected main results in 2017:

- Simulation for e.m. calorimeter of the Mu2e experiment.
- Tests of the CsI e.m. calorimeter elements on the gamma sources and electron beam.
- Creation and test of the CRV (cosmic ray veto) modules and counters on proton beam and cosmic muons.
- Development of the final software.
- Participation in development, teating and commissioning of the full DAQ system based on the MIDAS/ROME/PARAVIEW software frameworks for the Muon G-2 experiment.
- Participation in the radiation hardness tests of the detector elements.

Study of Neutrino Oscillations

Leaders:

D.V. Naumov
A.G. Olshevskiy

Participating Countries and International Organizations:

China, Czech Republic, France, Germany, Japan, Italy, Slovakia, Turkey, USA.

Scientific Programme

- Measurement of the θ_{13} neutrino mixing angle and Δm_{ee}^2 squared mass difference in Daya Bay experiment.
- Measurement of the solar neutrino fluxes in Borexino experiment, search for the sterile neutrino state.
- Study of the neutrino oscillations in OPERA experiment.
- Neutrino mass hierarchy determination and measurement of CP violation phase of the neutrino mixing matrix in JUNO and NOvA experiments.
- R&D for the new photo-detectors and detector equipment for the neutrino experiments.
- Improving of the precision of direct solar neutrino flux measurements with the Borexino detector, phase-II experiment.

Expected main results in 2017:

- Physics analysis of the Daya Bay experiment data.
- Sensitivity optimization to the mass hierarchy measurements and determination of neutrino oscillation parameters.
- Application of software algorithms for event reconstruction in NOvA experiments.
- Study of NOvA experiment systematic uncertainties related to the neutrino-nucleon cross sections and MSW effects for current NOvA analysis.
- Use of NOvA experiment Remote Operation Centre at JINR for shifts.
- Test of High Voltage prototype for JUNO PMT.
- Measurement of JUNO PMT characteristics.
- OPERA emulsions analysis at JINR.
- Preparation of the OPERA TT detectors for the use in JUNO experiment.
- Measurement of JUNO veto system prototype at JINR using OPERA detectors.
- Event coordinates reconstruction in Borexino detector.
- Analysis of solar neutrino parameters in Borexino detector.

Experiment PANDA at FAIR

Leader: G.D. Alexeev

Deputies: A.N. Skachkova
A.S. Vodopyanov

Participating Countries and International Organizations:

Belarus, CERN, Czech Republic, Germany, Italy, Russia, Slovakia.

Scientific Programme

The study of the exotic nuclear-matter states and nucleon structure in the PANDA experiment at FAIR.

Expected main results in 2017:

- Inclusion of MC generators into the PANDA software and optimization of the event analysis.
- Calculations of the superconducting solenoid sub-systems.
- Preparation of the FAIR-JINR contract for the production of the PANDA muon system.
- Test of Range System Prototype at CERN PS.

Astrophysical Studies in the Experiment TAIGA

Leader: L.G. Tkatchev
Deputy: V.M. Grebenyuk

Participating Countries and International Organizations:

Czech Republic, Germany, Japan, Italy, Mexico, Republic of Korea, Romania, Russia, Ukraine.

Scientific Programme

- The main topic of multi-messenger TAIGA array are Gamma-ray astronomy, charged cosmic ray physics and particle physics. Gamma-ray astronomy - one of the most intriguing questions in high-energy astroparticle physics is a search for galactic objects for accelerating of particles up to PeV-energies (the so-called Pevatrons); VHE spectra of known sources: where do they stop; absorption in IR and CMB; diffuse emission from galactic plane and local supercluster. Charged cosmic ray physics – the energy spectrum and mass composition measurements from 10^{14} to 10^{18} eV. Particle physics - axion/photon conversion; hidden photon/photon oscillations; Lorentz invariance violation; pp cross-section measurement; search for quark-gluon plasma phenomena.
- The TUS space experiment has been proposed to measure the energy spectrum, composition and angular distribution of the Ultra High Energy Cosmic Rays (UHECR) at $E \approx 10^{19} - 10^{20}$ eV, to study the region beyond the GZK cutoff. Existence of these particles is beyond the Standard Model of particle physics and is of great interest. The study from the orbit is much more effective in comparison with the ground-based detectors. The existing world statistics is assumed to be increased by a factor of 2 during 3 years of the global data taking. The TUS detector will make it possible to study UHECP neutrino Extensive Air Showers (EAS) from the space orbit.
- The aim of the NUCLEON Project is direct CR measurements in the energy range 10^{11} - 10^{15} eV and the atomic charge range up to $Z \approx 30$ in the near-Earth space to solve mainly the “knee” problem in the CR spectrum. The CR phenomena in this energy region are investigated in terrestrial experiments by measurement of EAS parameters or in balloon or space experiments. Below $\sim 10^{14}$ eV the spectrum and composition are known from direct observation with detectors placed in balloons and earth satellites. However, at higher energies the CR flux is smaller and more difficult for direct and needs observation. Precise measurement of the CR composition and anisotropy will help to test the existing theoretical concepts and will become a basis for further studies.

Expected main results in 2017:

- Design and production of IACT for TAIGA experiment.
- Participation in the MC simulation of TAIGA experiment.
- Production and test of the calibration system for TUS detector on the Earth orbit.
- Participation in the data taking of the TUS experiment.
- Participation in the TUS data off-line analysis.
- Participation in the data taking of the NUCLEON experiment and data analysis.

Investigations of Compressed Baryonic Matter at the GSI Accelerator Complex

Leaders: V.P. Ladygin
V.V. Ivanov
Deputy: P.K. Kurilkin

Participating Countries and International Organizations:

Bulgaria, Czech Republic, Germany, Mongolia, Romania, Russia, Slovakia, Uzbekistan, Ukraine.

Scientific Programme

Design of the superconducting dipole magnet, design and development of straw detectors for the CBM experiment at the GSI accelerator complex. Study of the multiparticle dynamics in heavy ion collisions at SIS100 and SIS300. Development of algorithms and software for the trigger, simulation and data analysis. Participation in HADES experimental at SIS18 and SIS100.

Expected main results in 2017:

- Preparation of the drawings of individual parts of the superconducting dipole magnet for the CBM experiment.
- Design and testing of the straw detectors.
- Development of the algorithms and software for the trigger and data analysis.
- Simulation of the multiparticle dynamics in heavy ion collisions.
- Development of the mathematical methods and fast computing algorithms for the data analysis and selection of the signal events.
- Participation in experimental data taking using pion, proton and heavy ion beams with HADES at SIS18. Development of the algorithms for data analysis. Further participation in experimental data analysis of dp (1.25 GeV/nucleon) and pp (3.5 GeV). Theoretical interpretation of the obtained data.

Study of Rare Charged Kaon Decays in Experiments at the CERN SPS

Leaders:

V.D. Kekelidze
Yu.K. Potrebenikov

Participating Countries and International Organizations:

Belgium, Bulgaria, CERN, Czech Republic, Germany, Italy, Mexico, Romania, Russia, Slovakia, United Kingdom, USA.

Scientific Programme

Realization of the NA62 Project allows to clarify CP-violation problem, to measure precisely very rare charged kaon decay to charged pions and two neutrinos, to carry out a search for supersymmetric particles and their partners with a goal to observe a physics beyond the Standard Model. In addition, characteristics of rare kaon and hyperon decays will be improved. A high resolution straw-detectors of the NA62 magnetic spectrometer working in vacuum will be supported during experimental runs. Software for simulation, data processing and analysis will be developed.

Expected main results in 2017:

- Data taking by the NA62 set-up and data analysis will be carried out.
- Software for the simulation of magnetic spectrometer and full set-up will be developed; system for detector calibration and event reconstruction will be upgraded; common software of the experiment will be developed.
- Calibration, testing and support of the NA62 straw detectors will be carried out.

CMS. Compact Muon Solenoid at the LHC

Leader: A.V. Zarubin
Scientific leader: I.A. Golutvin

Participating Countries and International Organizations:

Armenia, Austria, Belarus, Belgium, Brazil, Bulgaria, CERN, China, Croatia, Cyprus, Czech Republic, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, India, Iran, Italy, Mexico, New Zealand, Pakistan, Poland, Republic of Korea, Russia, Serbia, Slovakia, Spain, Switzerland, Taiwan, Turkey, Ukraine, United Kingdom, USA, Uzbekistan.

Scientific Programme

The CMS Collaboration has constructed a general-purpose detector to be operational at the start-up of the Large Hadron Collider (LHC/CERN) to exploit its full discovery potential. Study of fundamental properties of the matter in Super High Energy proton-proton and nucleus-nucleus interactions.

The major activities of JINR are focused on the following directions:

- forward calorimetry, including endcap hadron, and preshower detector;
- forward muon stations with cathode strip chambers;
- development of Physics program to test SM and BSM.

Expected main results in 2017:

- Upgrade and technical support of the CMS detectors.
- CMS start up shifts, data taking, and data quality monitoring.
- Processing and analysis of experimental data, development and improvement of muon and jet reconstruction algorithms.
- Development of software for GRID-based distributed system for data processing and analysis. Data transmission from CERN to JINR.

List of projects:

Project	Leader	Priority (period of realization)

Studies of the Nucleon and Hadron Structure at CERN

Leader: A.P. Nagaytsev
Scientific leader: I.A. Savin

Participating Countries and International Organizations:

Armenia, Bulgaria, CERN, Czech Republic, France, Germany, Israel, Italy, Japan, Poland, Russia, Switzerland, Ukraine, United Kingdom, USA.

Scientific Programme

Studies of the generalized parton distributions in various exclusive processes. Studies of the exclusive production of photons, pions and vector mesons in DIS and DVCS. Measurements of nucleon structure in the Drell–Yan processes. Study of inclusive and semi-inclusive processes in Deep Inelastic Scattering (DIS) of muons and hadrons on polarized targets.

- Measurements of the nucleon structure functions, polarized parton distributions.
- Measurements of nucleons structure in the Drell–Yan processes.
- Studies of the inclusive production of photons, pions and ρ -mesons in DIS and DVCS.
- Software creation and development for simulation and data analysis. System support of CERN software in COMPASS-II.
- Detector preparation for the COMPASS-II spectrometer.

Expected main results in 2017:

- Measurement of asymmetries in processes of the exclusive birth of photons (DVCS), π -mesons and vector mesons.
- Participation in the data taking.
- Maintenance of the hadron calorimeter HCAL1 and muon system MW1.
- Preparation for a data taking the new electromagnetic calorimeter ECALO. Support of ECALO during data taking.
- Software development and simulation of the various reactions, studied in COMPASS-II. Analyzing of the COMPASS-II data at JINR and publications preparation.
- Theoretical studies for COMPASS-I and COMPASS-II.

Strangeness in Hadronic Matter and Study of Inelastic Reactions Near Kinematical Borders

Leaders: E.A. Strokovsky
E.S. Kokouline

Participating Countries and International Organizations:
Belarus, Czech Republic, Germany, Japan, Russia, Ukraine.

Scientific Programme

Strangeness in hadronic matter and study of boundary effects:
study of stabilizing effects of strangeness in nuclear matter and properties of the lightest hypernuclei;
study of multi-particle dynamics in inelastic proton-proton and proton-nucleus interactions with extremely high multiplicity;
study of spectra and yields of soft photons in deuteron-nucleus and nucleus-nucleus interactions.

Expected results:

- Data on production cross sections for hyper-fragments of relativistic nuclei. Data on the lifetimes and binding energies of the lightest hypernuclei ${}^4_{\Lambda}H$, ${}^3_{\Lambda}H$, ${}^6_{\Lambda}H$; search for ${}^6_{\Lambda}H$. Study of the decay channels, including non-mesonic decays of the ${}^{10}_{\Lambda}Be$ and ${}^{10}_{\Lambda}B$ hypernuclei.
- New experimental data about the drip-line location for loosely bound light hypernuclei with high neutron excess. Development of theory of the neutron-rich hyper nuclei and models of their production in non-central nucleus-nucleus interactions.
- New experimental data about soft photon emission in deuteron-nuclei and other nuclei-nuclei interactions, including study of dependence of their energy spectra on electric charges of the projectile and target nuclei, as well as on multiplicity of secondaries.
- Development of theoretical and phenomenological models for description of data on the soft photon yield in the deuteron-nuclei and other nuclei-nuclei interactions, differentiated on multiplicity of secondaries.
- Construction of two-arm electromagnetic calorimeter for soft photon registration in a wide region of emission angles for study of interference patterns, for search of new resonances and verification of theoretical predictions about new phenomena in a dense nuclear matter.

Expected main results in 2017:

- Modernization of the FFE, DAQ and tracking systems of the NIS-GIBS spectrometer.
- Data taking on the hyper-nuclear program (search for the hyper-hydrogen 6) using the NIS-GIBS spectrometer at extracted beams of deuterons and 7Li nuclei.
- Analysis of data from LEPS spectrometer on vector-meson photoproduction by polarized photons.
- Analysis of data on soft ($E_{\gamma} < 50$ MeV) photon emission in deuteron-nuclei and other nuclei-nuclei interactions at kinetic energies above 2 GeV/nucleon.
- Preparation of the NEMAN project aimed on study of photon emission in non-central collisions of relativistic (with kinetic energies above 1 GeV/nucleon) light and heavy nuclei with nuclei at the BM@N setup.

Development of the JINR Basic Facility for Generation of Intense Heavy Ion and Polarized Nuclear Beams Aimed at Searching for the Mixed Phase of Nuclear Matter and Investigation of Polarization Phenomena at the Collision Energies up to $\sqrt{s_{NN}} = 11$ GeV

Leaders: A.S. Sorin
V.D. Kekelidze
G.V. Trubnikov

Deputies: I.N. Meshkov
A.D. Kovalenko

Participating Countries and International Organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, CERN, China, Czech Republic, Egypt, France, Georgia, Germany, Italy, Israel, Japan, Moldova, Poland, Romania, Russia, Slovakia, South Africa, Sweden, Ukraine, USA.

Scientific Programme

Search and investigation of phase transitions and critical phenomena in strongly interacting matter at extremely high baryon densities, of nucleon spin structure, study of polarization phenomena in few-body systems and light nuclei. Development of theoretical models of these processes and theoretical support of the experiments. Development of the Nuclotron accelerator complex as a basic facility for studying relativistic nuclear collisions in the range of atomic masses $A = 1-197$ and the construction of the BM@N detector. Studies of the reaction dynamics and the in-medium properties of hadrons, production of strange hyperons at the threshold and search for hyper-nuclei in interactions of heavy ion beams of the Nuclotron with fixed targets. The study at the detector BM@N of nuclear structure at small internucleon distances. Development and construction of the heavy ion collider NICA, multipurpose detector (MPD/NICA) and spin physics detector (SPD/NICA) for the collide experiments with heavy ions. Modernization of the extraction beam lines. Carrying out of experiments with nuclear beams and polarized deuteron beams at the Nuclotron

Expected main results in 2017:

- Development and extension of the NICA “White Paper” – project physics program. Continuation of theoretical studies of non-perturbative QCD processes, development and tests of the models for the nuclear matter at high temperatures and densities aimed at investigation of phases of nuclear matter, dynamics of nuclear collisions at extremely high baryonic densities and observation of these phenomena in P-odd effects and spin asymmetries.
- The Nuclotron modernization in framework of the Nuclotron–NICA project: continuation of the operational regimes optimization of the heavy ion source KRION-6T, design and beginning of creation of the operational heavy ion source KRION-N, technical improvement of the cryogenic and injection complex. Development of the system for beam diagnostics. Put into operation the polarized particle source SPI. Annual dedicated machine development runs at Nuclotron on first priority tasks within running time of 400 hours. Start of conceptual design of superconducting resonator for proton linac.
- Completion of the linear heavy ion accelerator HILAC ($z/A \geq 0.14$) commissioning, obtain of the design parameters. Put into operation RFQ fore-injector for LU-20. Acceleration of polarized deuteron beam at the Nuclotron. Continuation of the serial production of superconducting for the NICA project. Development and creation of test benches, modernization of the engineering infrastructure.
- Preparation of the technical project for the beam transfer line from Booster to Nuclotron.

- Preparation of working project for housing of the NICA collider elements and systems, continuation of the civil construction.
- Construction and commissioning of the first stage of the BM@N experimental setup, collection of first experimental data of interactions of light and medium ion beams with fixed targets. Perform simulation of the counting rate for the measurements of correlation of three nucleons. Prepare technical design for measurements of the short range correlation with additional detectors and additional radiation protection.
- Realization of the technical project of the MPD solenoid and the order for its manufacturing. Prototyping the detector elements for the first stage of the project. MPD Technical Design Project preparation.
- Preparation of the Conceptual Design Project to study nucleon spin structure with SPD. Continuation of theoretical studies of the Matveev–Muradyan–Tavkhelidze–Drell–Yan processes, production processes and other processes in light polarized nuclei collisions.
- Nuclotron runs dedicated to physics and machine development within running time of 1000 hours.
- Development of the NICA/MPD/BM@N/SPD computer infrastructure.

List of projects:

Project	Leader	Priority (period of realization)

Advanced Studies on Systems of New-Generation Accelerators and Colliders for Fundamental and Applied Research

Leader: G.D. Shirkov
Deputy: J.A. Budagov

Participating Countries and International Organizations:

Armenia, Belarus, Bulgaria, CERN, Czech Republic, Germany, Georgia, Greece, Italy, Japan, Poland, Russia, Slovakia, South Africa, United Kingdom, Ukraine, USA.

Scientific Programme

JINR participation in international collaborations for the design, creation and improvement of new generation accelerators and colliders by scientific researches and experimental development in the field of particle accelerators physics: design of cryomodules and accelerating structures with superconducting cavities; studies of free electron laser physics, development and construction of diagnostic and accelerator systems applied for ultra short dense bunches in the linear electron accelerators; development and construction of systems applied for formation and diagnostics of ultra short dense bunches in the linear electron accelerators; construction of test facilities for accelerating structures investigation; development and creation of a new generation instrumentation for precision laser metrology of accelerators and detector complexes to increase their luminosity and work parameters. Common investigations in the field of laser-plasma accelerators. On a base of electron linac bench: construction of the stand for calibration of electromagnetic calorimeters and investigations of other detectors and their characteristics; creation of complex for the laboratory and practical trainings of students and PhD students - future engineers from JINR member states.

Expected main results in 2017:

- Injector photogun beam dynamics modeling and optimization. Fabrication and investigation of the “transparent” thin-film. Photoinjector prototype commissioning (80–100 keV).
- Optimization of the Linac-200 beam parameters at 200 MeV energy. Design of the UV FEL vacuum beamline and magnet system. Beam extraction into atmosphere for detector parameters investigation, design and manufacturing of beam parallel transfer system (LNP program) after 2-nd, 3-nd and 4-th accelerating station. Mounting of the waveguide RF switch for VARIAN klystron. Work on reconstruction and modernization of the control and interlock systems.
- The final phase R&D’s on compact vacuumed two-coordinates Precision Laser Inclinator with 1 nrad resolution. Designing and construction of prototype of Absolute Distance Meter with 1 μm resolution for distances of 1–10 m. R&D’s for 150 meter long Laser Fiducial Line with possibility of simultaneous measurements of space coordinates of 6 points on the object controlled with 10 μm precision (the nondestructive control).
- Development of education program on the base on working with real Linac-200 equipment for students and PhD students – future engineers from JINR member states; laboratory and practical trainings at Linac-200 accelerator.
- Investigation of electron beam and FEL physics: generation of infrared radiation from JINR undulator at FLASH and measurements of longitudinal bunch profile on basis of this radiation; diagnostic of electron bunches at FLASH2 by using of microchannel plate detectors; test experiments with XFEL microchannel plate detectors on synchrotron sources PETRA III, experimental investigations of 3D ellipsoidal shape electron bunches in PITZ with new laser system.

- Preparation of the proposal of the JINR participation in international collaborations on the design study of future high-energy colliders.

List of projects:

Project	Leader	Priority (period of realization)
1. Design, construction and test of prototype elements for New-generation accelerators and colliders for fundamental and applied purposes.	G.D. Shirkov G.V. Trubnikov	1 (2016 – 2018)
2. Precision laser metrology for accelerators and detector complexes	Yu.A. Budagov M.V. Lyablin	1 (2016 – 2018)

Study of Polarization Phenomena and Spin Effects at the JINR Nuclotron-M Facility

Leader: A.D. Kovalenko

Deputies: N.M. Piskunov
V.P. Ladygin
M. Finger (Jr.)
R.A. Shindin

Participating Countries and International Organizations:

Belarus, Bulgaria, CERN, Czech Republic, France, Germany, Japan, Poland, Romania, Russia, Slovakia, Sweden, Switzerland, Ukraine, United Kingdom, USA, Uzbekistan.

Scientific Programme

Methodical support of the experiments at polarized beams of the Nuclotron-M and NICA facilities, including development of polarimetry systems. Measurement of analyzing power for the reaction $p + CH_2$ at polarized proton momentum up to 7.5 GeV/c and polarized neutrons momentum 4.5 GeV/c at the setup ALPOM-2. Measurement of tensor analyzing power and spin correlation in $d \rightarrow p$ reaction in the deuteron core area with the use of polarized 3He target and polarized deuteron beam of the Nuclotron-M. Study of 2N- and 3N-correlations in deuteron-proton elastic scattering and deuteron break-up reactions at the Nuclotron internal target. Works on modernization of Saclay-Argonne-JINR polarized proton target (setup PPT). The analysis of set of the np spin observables at 0° (the total np cross section differences), using polarized targets and quasi-monochromatic relativistic 1.2-3.6 GeV neutron beams. Determination of the forward scattering NN amplitudes over this energy region. Comparison of the obtained data with QCD motivated model calculations. Study of charge-exchange processes in dp -interactions at the setup STRELA. Development of theoretical models for description of the simplest nuclear systems taking into account relativistic effects, meson and quark-gluon components of the internal movement. Theoretical analysis of experimental data obtained at Nuclotron-M. The study of the properties of strongly interacting matter utilizing polarization phenomena in hadron-nucleon and lepton-nucleon interactions, and in the decay of polarized radioactive atomic nuclei. Study of highly excited nuclear matter and collective effects in nuclear media; delta and other nucleonic resonance excitations on protons and nuclei. Preparation of the setup DELTA-LNS and data taking on the light neutral mesons production in polarized nucleons and nucleus interactions.

Expected main results in 2017:

- Works:
 - a) study of low energy proton and deuteron polarimeter within the frames of the program: "Spin Physics Research Infrastructure at the Nuclotron";
 - b) preparation to the measurements of analyzing power of neutron-CH scattering at polarized neutron momentum from 3 to 4.5 GeV/c.
- Completion of stages of the approved projects and collaborative protocols within the frames of their real financial support, including:
 - a) realization of the projects ALPOM-2 and DSS;
 - b) experiments at the setup ALPOM-2 analysis of the collected data from DELTA-SIGMA setup.
- Participation in the design and construction of BM@N setup in accordance with general plan.
- Participation in the joint scientific programs and experiments, design and test of the new detectors and electronics for the use at SPS LHC, FCC (CERN), RHIC (BNL), TJNAF (Newport News), FAIR (GSI) in accordance with the approved collaborative agreements.

- Continuation of the development of the new methods to calculation of the amplitudes and polarization characteristics of deuteron fragmentation and deuteron elastic scattering on protons and nuclei taking into account FSI and relativistic effects.

Research on Relativistic Heavy and Light Ion Physics. Experiments at the Nuclotron, SPS and SIS18

Leader: A.I. Malakhov
Deputy: S.V. Afanasiev

Participating Countries and International Organizations:

Armenia, Bulgaria, CERN, China, Czech Republic, France, Germany, Japan, India, Kazakhstan, Mongolia, Poland, Romania, Russia, Slovakia, Sweden, Switzerland, Tajikistan, USA, Uzbekistan.

Scientific Programme

Scientific Programme

Search for manifestation of quark-gluon degrees of freedom in collisions of relativistic nuclei and phase transitions in nuclei and exotic resonances. Study of nuclear multifragmentation processes. The Nuclotron internal target experiments. Asymptotics in nuclear collisions and nucleon clusters. Detector development for relativistic heavy-ion experiments at the CERN and BNL. Investigation of the interactions of nuclei at energy 20-158 GeV on a nucleon on NA61/SHINE experiment (SPS, CERN). Study of hadron production in hadron-nucleus interactions. Use of these data for precise predictions of neutrino fluxes in neutrino oscillation experiments at accelerators. Study of fragmentation of light stable and radioactive nuclei with beams of secondary nuclei and data analysis. Studies of cluster structure of light stable and radioactive nuclei in relativistic dissociation. Studies of multifragmentation of heavy nuclei. Study of the properties strong interaction matter. Study of the particles properties in nuclear matter at the Nuclotron.

Expected main results in 2017:

- Continuation of experiments with the internal target at the Nuclotron. Preparation and carrying out of experiments with extracted beams at the Nuclotron. Development of the software for modeling and processing experimental data.
- Participation in realization NA61. Study of hadron production in proton-carbon interactions at 30 GeV in the NA61/SHINE experiment at CERN. Use of these data for improved predictions of neutrino fluxes and precise determination of neutrino oscillation parameters in the T2K experiment in Japan.
- Experimental study of the properties of hot nuclei produced in the collisions of the light relativistic projectiles with heavy target. Measuring and analysis of the longitudinal versus transversal velocity components of fragments in order to understand the degree of the equilibration involved in the disassembly process. The elaboration of the trigger system for decay registration of hypernuclei.
- Study of multiparticle dynamics in terms of masses and energies of colliding objects and centrality of interaction. Mathematical modeling of experiments on investigation of the properties of highly excited states of nuclear matter in relativistic nuclear collisions and the mechanism of quark hadronization in the process of pion pair production.
- Search for eta-mesic nuclei formed in dA collisions, the determination of the total cross section of eta-nucleus production in dA collisions and its energy and A-dependence, the construction and production of the neutron detector for this experiment. Investigation of scintillators at high beam intensity.
- Preparation of the physical programme for experiments at SIS18 and SIS100.
- Analysis of nuclear track emulsion exposed to the isotopes B-10 and C-11. Exposure of emulsion in secondary beam of the radioactive isotope Be-10. Exposures to heavy nuclei. Test exposures of emulsion in range of hundreds MeV per nucleon.

- Study of nuclear interactions depending on projectile mass and energy with the beams of relativistic nuclei at the Nuclotron and other accelerators with the photo-emulsion method. Study of fragmentation, multifragmentation, multiparticle production together with correlations between them at interaction of nuclei of various energies with photo-emulsion nuclei. Search for collective effects in central nuclear-nuclear collisions in photo-emulsions.
- Search and study of new phenomena based on the data obtained using bubble chambers; Theoretical interpretation of these results. Creation of the data base of experimental data and educational programs in the field of relativistic nuclear physics.
- Study of deep subthreshold processes, applied and educational programs at MARUSYA setup. Construction of electromagnetic detector of MARUSYA setup and test channel and corresponding electronics for detector testing.
- Investigations with light and heavy ions for applied research.
- Elaborate schemes of measurement and experimental study (energy and time resolution) of the hadron calorimeter, designed to monitor and measure the luminosity at the collider NICA, and the neutron detector, designed for the study of nuclear structure isospin internucleonic on small distances. It uses beam-formed channel 4B and installing infrastructure of the SPHERE setup.

Investigation of the Properties of Nuclear Matter and Particle Structure at the Collider of Relativistic Nuclei and Polarized Protons

Leaders:

R. Lednický
Yu.A. Panebratsev

Participating Countries and International Organizations:

Armenia, Azerbaijan, Czech Republic, France, Germany, Poland, Russia, Slovakia, USA.

Scientific Programme

Investigation of the properties of nuclear matter with extremely high density and temperature, search for the signs of the quark deconfinement and possible phase transitions at the collisions of heavy nuclei at the energies of the Relativistic Heavy Ion Collider (RHIC). Measurement of spin dependent structure functions of nucleons and nuclei using polarized RHIC beams.

Expected main results in 2017:

- The data on heavy ion and polarized proton–proton and polarized proton nucleus collisions taken in the STAR experiment at RHIC.
- Beam energy measurement of transverse spin asymmetry in polarized pp collisions at energy 510 GeV and study of sign change in Sivers function.
- Measurements of event structure, collective variables, correlation characteristics, femtosopic correlation functions and high P_T processes.
- Measurement of spin depended and gluon structure functions in polarized proton collisions with Al an Au nuclei.
- Participation in JINR–BNL and JINR–CERN joint educational programs.

ALICE. Study of Interactions of Heavy Ion and Proton Beams at the LHC

Leader: A.S. Vodopyanov

Participating Countries and International Organizations:

Armenia, Bulgaria, CERN, China, Croatia, Czech Republic, Denmark, France, Germany, Greece, Hungary, India, Italy, Mongolia, Netherlands, Norway, Poland, Republic of Korea, Romania, Russia, Slovakia, South Africa, Sweden, Switzerland, Ukraine, United Kingdom, USA.

Scientific Programme

1. Participation in the preparation of ALICE upgrade (Photon spectrometer PHOS, assembly of the setup).
2. Realization of experiments at the LHC.
3. Physics research program at the ALICE detector.
4. Development and upgrade of data analysis computing GRID-ALICE in Russia.

Expected main results in 2017:

- Participation in the R&D for the upgrade of photon spectrometer PHOS.
- Participation in the physics project preparation. Physics simulation of heavy ions and protons interactions at LHC energies.
- Data analysis. Preparation of publications.
- Upgrade, testing and supporting of GRID.

List of projects:

Project	Leader	Priority (period of realization)
1. ALICE	A.S. Vodopyanov	1 (2010 – 2019)
2. R&D for the ALICE Photon Spectrometer	A.S. Vodopyanov	1 (2010 – 2018)

List of activities:

Activity or experiment Laboratory or other Division of JINR Responsible person	Leaders Main researchers	Status

Development and Construction of the Prototype of a Complex for Radiotherapy and Applied Research with Heavy-Ion Beams at the Nuclotron-M

Leaders:

S.I. Tyutyunnikov

Participating Countries and International Organizations:

Armenia, Australia, Belarus, Bulgaria, Czech Republic, India, Germany, Greece, Moldova, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, Ukraine.

Scientific Programme

Investigation of new aspects of electronuclear power engineering and process of energy production and radioactive waste transmutation at various subcritical setups, research of radiation hardness of materials.

Expected main results:

- Investigation of physical characteristics of the assemblies, the massive uranium target with a lead reflector – (set-up “Quinta”), the quasi infinite uranium target BURAN with the energy of the proton and deuteron beams of the Nuclotron in the interval from 0.6 up to 12.0 GeV. Receiving data about the multiplicities and special distribution of energy–time neutron spectra. Research on massive targets of natural (depleted) uranium and thorium energy production capabilities and processing of radioactive waste based on the basic principles of relativistic nuclear technologies (RNT), the study of radiation hardness of superconductors by the beams of neutrons and protons.

Expected main results in 2017:

- Pilot operation of the neutron spectrometer on recoil protons on the “Quinta” under irradiation with protons and heavy particle beam at the Nuclotron–M and Phazotron.
- Investigation of the efficiency of neutrons generation on heavy ion beams Li, C on the “Quinta”.
- Installation of a big uranium target on Phazotron, beam adjustment on the target.
- Investigation of impact of high–power laser radiation on the radioactive decay of minor actinides.
- Using of nuclear membrane and track detectors for physics experiments at the Nuclotron–M.

List of activities:

Activity or experiment Laboratory or other Division of JINR Responsible person	Leaders Main researchers	Status

Development of the FLNR Accelerator Complex and Experimental Setups (DRIBS-III)

Leaders:

G.G. Gulbekyan
S.N. Dmitriev

Scientific leader:

M.G. Itkis
Yu.Ts. Oganessian

Participating Countries and International Organizations:

Belgium, Bulgaria, CERN, China, Czech Republic, Egypt, France, Germany, Italy, Kazakhstan, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, South Africa, Ukraine, Uzbekistan, USA.

Scientific Programme

The implementation of the DRIBS-III project that includes the upgrade and development of the FLNR cyclotron complex, the expansion of the experimental infrastructure of the laboratory (construction of new physics setups), and the development of the accelerator systems. The project leads to an increase in the operation stability of the accelerators, an increase in the intensity of the ion beams of stable and radioactive nuclides in the energy range from 5 to 100 MeV/nucleon, and an improvement of the quality of the beams with a simultaneous reduction of power consumption. The project aims to significantly improve the efficiency of experiments on the synthesis of superheavy elements and light nuclei at nucleon drip lines and on the study of their properties. Moreover, the programme of experiments with beams of radioactive nuclides is anticipated to be extended.

Main results expected in 2017:

- Completion of the construction and commissioning of a new experimental building of the SHE Factory equipped with engineering systems.
- Installation of the equipment and DC-280 cyclotron systems in the experimental hall of the SHE Factory. Pre-commissioning works. Extraction of beams of accelerated heavy ions.
- Construction and commissioning of a gas-filled recoil separator DGFRS-2.
- Commissioning and conducting of test experiments at the new ACCULINNA-2 fragment separator (U-400M cyclotron) using beams of light ions with energies of 30 to 50 MeV/nucleon. Development of the infrastructure of the fragment separator ACCULINNA-2.
- Conducting of experiments with 6-15 MeV/nucleon ion beams at the U-400M cyclotron.
- Production of the intense beams of highly charged ions heavier than Xe using a superconducting ion source and their acceleration in the U-400M cyclotron.
- Implementation of experiments on the synthesis of new isotopes in the region of superheavy elements at the U-400 cyclotron using actinide targets and on the nuclear spectroscopy of heavy ions.
- Development of techniques for the synthesis and radiochemical extraction of radionuclides that have great potential for nuclear medicine and are promising as tracers. Development of equipment and conducting of experiments with beams at the MT-25 microtron.
- Development of new methods of beam diagnostics for stable and radioactive nuclides.
- Construction of a new Gas-cell based Laser-ionization Setup (GALS) for on-line separation of reaction products by selective laser ionization.
- Development of a two-arm mass-spectrometer MAVR.
- Design of separate nodes of the gas ion catcher.

Synthesis and Properties of Superheavy Elements, Structure of Nuclei at the Limits of Nucleon Stability

Leader: M.G. Itkis
Scientific leader: Yu.Ts. Oganessian

Participating Countries and International Organizations:

Belgium, Bulgaria, CERN, China, Czech Republic, Finland, France, Germany, Egypt, India, Italy, Japan, Kazakhstan, Mongolia, Poland, Romania, Russia, Slovakia, South Africa, Spain, Switzerland, Sweden, Ukraine, United Kingdom, USA.

Scientific Programme

Synthesis and investigation of the properties of nuclei at stability limits. Investigation of the mechanisms of heavy-ion-induced reactions. Study of physical and chemical properties of heavy and superheavy elements.

Main results expected in 2017:

- Carrying out of experiments on the synthesis of heavy isotopes of element 118 (reaction $^{48}\text{Ca} + ^{249-251}\text{Cf}$) and neutron-deficient isotopes of elements Fl and 115 at the gas-filled separator.
- Studies of the decay properties of Rf, Db and Sg isotopes using the separator SHELS + GABRIELA. Preparation of an experiment on the spectroscopy studies of the decay properties of the $^{288}\text{115}$ isotope and its daughter products. Carrying out of experiments on measurement of the multiplicity of prompt neutrons from the spontaneous fission of Rf and Db isotopes.
- Conducting of experiments on the study of chemical properties of element 113. Conducting of experiments on the study of Cn and Fl selenides.
- Measurement of the excitation functions of the xn evaporation channels in the complete fusion reactions $^{40}\text{Ar} + ^{144}\text{Sm}$, $^{40}\text{Ar} + ^{164}\text{Er}$, $^{16}\text{O} + ^{198}\text{Pt}$, and $^{18}\text{O} + ^{198}\text{Pt}$. Study of the yields of products of multi-nucleon transfer reactions in the vicinity of the neutron shell closure $N = 126$ using the mass-spectroscopic methods.
- Production and study of the properties of new neutron-rich heavy nuclei in binary multi-nucleon transfer processes and quasi-fission. Investigation of the mass-energy distributions of fragments produced in the reactions $^{160}\text{Gd} + ^{186}\text{W}$, ^{198}Pt , $^{52,54}\text{Cr} + ^{232}\text{Th}$, and $^{84}\text{Kr} + ^{198}\text{Pt}$. Study of the multi-body decays of low-excited heavy nuclei.
- Investigation of the structure of the exotic nuclei ^5H , ^{10}Li , ^{17}Ne , ^{26}P , and ^{27}S using radioactive beams at the ACCULINNA-1 and ACCULINNA-2 setups.
- Measurement of the total reaction cross sections for the collisions of the radioactive nuclei $^{6,8}\text{He}$, $^{8,9,11}\text{Li}$, ^{14}Be , and ^8B with different targets in a wide range of energies, from the near-barrier up to 30 MeV/nucleon. Study of the mechanism of formation of new nuclei in reactions with beams of rare neutron-rich nuclei (^{36}S , ^{48}Ca , ^{70}Zn , etc.) with energies of up to 20 MeV/nucleon.
- Theoretical studies of the mechanisms of heavy-ion-induced reactions.
- Development and update of the network knowledge base on nuclear physics.
- Investigation of shapes and sizes of exotic nuclei employing laser spectroscopy methods.
- Design and construction of an ECR ion source and a hot solid-state catcher with a chemical inactive coating of the inner parts of the vacuum chambers for the MASHA separator.

List of activities:

Non-Accelerator Neutrino Physics and Astrophysics

Leaders:

V.B. Brudanin
A. Kovalik
E.A. Yakushev

Participating Countries and International Organizations:

Armenia, Belgium, Bulgaria, Czech Republic, Finland, France, Germany, Kazakhstan, Mongolia, Poland, Romania, Russia, Slovakia, Ukraine, USA, United Kingdom, Uzbekistan.

Scientific Programme

Search for and investigation of double-neutrino and neutrinoless modes of double beta-decay, clarification of the neutrino nature Majorana or Dirac, absolute neutrino mass scale and hierarchies. Search for the neutrino magnetic moment and dark matter. Investigation of galactic and extragalactic neutrino sources, diffusive neutrino cosmic background, search for exotic particles (monopoles). Application of the neutrino detector for a distant investigation of process inside of the reactor core of Kalinin Nuclear Power Plant. Search for sterile neutrinos. Spectroscopy of nuclei far from stability. Development of new methods for charged and neutral particle detection.

Expected main results in 2017:

- Data taking in the $2\beta 0\nu$ -decay measurements of ^{106}Cd , ^{82}Se , ^{150}Nd , ^{76}Ge with the SuperNEMO and GERDA spectrometers.
- Processing of experimental data and determination of $T_{1/2}(2\beta 2\nu)$ for ^{48}Ca , ^{96}Zr , ^{130}Te , ^{116}Cd , ^{150}Nd , ^{82}Se and ^{76}Ge .
- Data taking with the GEMMA-II spectrometer at the Kalinin Nuclear Power Plant; getting an upper limit for the neutrino magnetic moment at the level of $\sim 2 \cdot 10^{-11} \mu_B$.
- Data taking with forty FID800 detectors (cumulative fiducial mass 24 kg) in the upgraded EDELWEISS setup. Data taking with two special low energy threshold (from ~ 0.5 keV) detectors in order to investigate the low mass WIMP region. The aim is to reach a WIMP-nucleon scattering cross-section sensitivity of $5 \cdot 10^{-45} \text{cm}^2$.
- Research and development of the semiconductor-based detecting systems for the GERDA and MAJORANA experiments. Beginning of data taking in the experiment on the search for the ^{76}Ge $2\beta 0\nu$ -decay.
- Deployment and extension of the first cluster "Dubna" at Baikal-GVD array. Data taking and extraction of physical results with the detector.
- Investigation of KLL and KMM Auger electrons in ^{65}Zn , ^{67}Cu , ^{67}Ga and $^{152,154,155}\text{Eu}$ decays.
- Design and creation of the low-threshold (~ 200 eV) HPGe detector. Production of low-background plastic scintillators for the SuperNEMO experiment.
- Design and creation of the reactor antineutrino detector DANSS. Start of data taking.

List of projects:

Project	Leader	Priority (period of realization)

Status:

Extended

Physics of Light Mesons

Leader:

A.V. Kulikov

Deputy:

Z. Tsamalaidze

Participating Countries and International Organizations:

Belarus, Bulgaria, Croatia, Canada, Czech Republic, Georgia, Germany, Italy, Poland, Romania, Russia, Switzerland, USA, Japan.

Scientific Programme

Investigation of strong, weak and electromagnetic interactions of elementary particles and light nuclei at intermediate energies with the aim of determining symmetries and dynamics of the interactions. Development and construction of setups for experiments at accelerators for obtaining new information and testing the present theoretical views in the topics. Development of projects for new experiments and experimental methods for intermediate-energy physics.

Expected main results in 2017:

- Processing of the experimental data for decays $\mu^+ \rightarrow e^+\gamma$ and $\pi \rightarrow e\nu$.
- Measurements of spin observables at longitudinally and transversely polarized COSY beam. Development of the polarimeter for the experiment on search for electric dipole moment.
- Data taking and data processing for $p + t$ fusion reaction using the muon catalysis method.
- Determination of branching ratios for reaction channels of pion interactions with the helium nucleus at the JINR Phasotron.
- Study of the dynamic behavior of magnetic nanoparticles at the cobalt ferrites by the muon spin rotation technique. Hyperfine interaction of acceptor center in semiconductors.
- Experiments with the "Active Target" (GDH).
- Measurement of A_N for the inclusive and exclusive reactions $\pi^- p \rightarrow \omega (782)n$ and $\pi^- p \rightarrow \eta' (958)n$.
- R&D on thin-wall straw-tubes for experiment COMET. Development, production and tests of the straw detector and electromagnetic calorimeter prototypes with a beam.

Improvement of the JINR Phasotron and Design of Cyclotrons for Fundamental and Applied Research

Leaders: G.A. Karamysheva

S.L. Yakovenko

Scientific leader: L.M. Onischenko

Participating Countries and International Organizations:

Belgium, China, Poland, Japan, USA, Uzbekistan.

Scientific Programme

Improvement of the JINR Phasotron and beam channels. Design of the cyclotrons for medical purposes. Development of the cyclotron method for high-current beam acceleration.

Expected main results in 2017:

- Modernization of the automated beam channel control system of JINR Phasotron.
- Carrying out simulation and experimental works on AIC-144 cyclotron increase of the beam extraction factor. Participation in the development of the magnets for the beam transport line to the cabin of the eye melanoma therapy.
- Development of the project superconducting cyclotron for SC200 proton therapy.
- Axial injection design and construction stage simulations for ProNova K230 superconducting cyclotron for proton therapy.

Investigations of Neutron Nuclear Interactions and Properties of the Neutron

Leader: V.N. Shvetsov
Deputies: Yu.N. Kopatch
 E.V. Lychagin
 P.V. Sedyshev

Participating Countries and International Organizations:

Albania, Australia, Austria, Azerbaijan, Belarus, Belgium, Bulgaria, CERN, China, Croatia, Czech Republic, Egypt, Finland, France, Georgia, Germany, Hungary, India, Italy, Japan, Kazakhstan, Macedonia, Moldova, Mongolia, Norway, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, Slovenia, South Africa, Switzerland, Thailand, Turkey, Ukraine, USA, Vietnam.

Scientific Programme

Experimental and theoretical investigation of symmetry breaking effects in reactions with neutrons and fundamental properties of the neutron to test the parameters of the Standard Model and search for “new physics”. Investigation of the properties of excited nuclei, reactions with emission of charged particles, fission physics. Obtaining of relevant data for astrophysics, nuclear power engineering and nuclear waste transmutation problem using neutron- and gamma-induced reactions. Application of neutron physics methods in other fields of science and technology. Development and construction of detectors of neutrons and other ionizing radiation, as well as applied methods in nuclear physics with neutrons. Development of the Intense REsonance Neutron Source (IREN) and the experimental base at the IREN and IBR-2 facilities.

Expected main results in 2017:

Investigations of violations of fundamental symmetries in neutron-nucleus interactions and related data

- Determination of parameters of the ROT-effect in the fission of ^{235}U by neutrons with an energy of 0.3 eV.
- Treatment of the results from the measurements of P-odd effect in the reaction of $^{10}\text{B}(n,\alpha)^7\text{Li}$ performed in 2016 at ILL, Grenoble.
- Development of the design of an instrument for measuring the P-odd effect in the reaction of $^3\text{He}(n,p)^3\text{H}$.
- Investigation of neutron paramagnetic resonance of the first kind in samples of titanium hydride TiH_2 in the polarized neutron energy range of 0.062-2.3 eV using the KOLKHIDA facility at the IBR-2 reactor.
- Investigation of prompt fission neutrons and superfluidity properties of fission fragments (IREN). Investigation of the dynamics of interaction of Fermi- and Bose-states of nuclear matter on the basis of experimental data on the intensities of two-quantum cascades of radiative neutron capture in various excited nuclei including actinides and fission products. The corresponding analysis of data from the experiment with a ^{93}Nb target performed in Budapest by employees of the University of Novi Sad, Belgrade.
- Measurement and analysis of angular correlations in the emission of neutrons and light charged particles in the spontaneous fission of ^{252}Cf .
- Measurement of angular correlations in the emission of neutrons and gamma-rays in inelastic neutron scattering for various elements in the framework of the TANGRA project.
- Development of an alpha spectrometer on beamline №1 of IREN; test measurements of the $^6\text{Li}(n,\alpha)^3\text{H}$ reaction.

- Measurements of the (n,α) reaction with Ni-58,60,61 isotopes for neutron energies $E_n = 4.5-6.5$ MeV at the accelerators EG-5 in FLNP JINR and EG-4.5 of the Institute of Heavy Ion Physics of Peking University.
- Treatment of experimental data from the measurements of the $^{25}\text{Mg}(n,\alpha)^{22}\text{Ne}$ and $^{91}\text{Zr}(n,\alpha)^{88}\text{Sr}$ reactions induced by fast neutrons.

Investigation of fundamental properties of the neutron, UCN physics:

- Experimental determination of characteristics of resonance transitions between quantum states of neutrons in the gravitational field of the Earth using the GRANIT spectrometer.
- Determination of the possibility of practical application of diamond nanopowder reflectors for targeted extraction of very cold neutrons.
- Development of the design of a setup to measure the energy dependence of the UCN loss factor in the energy range close to limiting values.
- Design and manufacture of a new time-of-flight Fourier diffractometer for neutron free fall experiments.
- Preparation of the experiment for observation of neutron quantum tunneling through an oscillating potential structure: quantum calculations, development and testing of the experimental setup.
- Nonstationary quantum experiments with slow neutrons: neutron diffraction by surface ultrasonic waves and reflection from an oscillating mirror.

Applied and methodological research:

- Development of gas-filled position-sensitive detectors of charged particles to conduct investigations of nuclear fission, in neutron radiography and in condensed matter physics.
- Inspection of the technical condition of the charged particle accelerator EG-5 in the framework of preparation to the development of a microbeam.
- Investigation of depth profiles of elements in the near-surface layers of solids using nuclear-physics methods (Elastic Recoil Detection Analysis and Rutherford Backscattering Spectrometry).
- Elemental and isotopic analysis of samples at the IREN facility using neutron spectroscopy, neutron and gamma activation analyses.
- Development of the elemental analysis of geological specimens and ores using the tagged neutron method as well as standard neutron sources.
- Carrying out of neutron activation analysis of environmental, geological, biological samples and novel materials at the IBR-2 reactor using the REGATA facility in the framework of the projects supported by grants and programs of Member States and Associated Members of JINR, RFBR and IAEA.
- Upgrade of hot cells of the REGATA facility to work with highly active samples.
- Improvement of the database for carrying out NAA using three automatic sample changers to measure the induced radioactivity generated by irradiation in the IBR-2 beamlines.
- Construction of a spectrometric system to measure natural and man-made radioactivity for radioecological and materials science research.

Development of the IREN facility

- Operation of the accelerator comprising two accelerating sections with a beam at a frequency of 50 Hz. Providing the neutron beam time of 1000 hours from IREN for physical experiments.
- Modernization of experimental beamline N1 of the IREN facility.

Investigations of Condensed Matter by Modern Neutron Scattering Methods

Leaders:

D.P. Kozlenko
V.L. Aksenov
A.M. Balagurov

Participating Countries and International Organizations:

Argentina, Azerbaijan, Belarus, Bulgaria, Czech Republic, Egypt, France, Germany, Hungary, India, Italy, Japan, Kazakhstan, Latvia, Moldova, Mongolia, Norway, Poland, Romania, Russia, Serbia, Slovakia, Spain, South Africa, Switzerland, Taiwan, Tajikistan, Ukraine, United Kingdom, Uzbekistan, Vietnam.

Scientific Programme

Investigations of structure, dynamics and microscopic properties of novel materials and nanosystems, interesting for fundamental research in the fields of condensed matter physics, chemistry, materials science, geophysics, and important for the development of nanotechnologies in the field of electronics, pharmacology, medicine by neutron scattering and complimentary methods.

Expected main results in 2017:

Realization of the scientific program:

- Determination of parameters of atomic and magnetic structure of bulk and nanostructured functional materials demonstrating interesting physical phenomena and being promising for technological applications in a wide range of thermodynamic parameters; exploration of the role of cluster aggregation in the formation of physical properties.
- Determination of characteristics of atomic and magnetic structure of nanosized complex manganese oxides.
- Analysis of the relationship between changes of atomic and magnetic structure parameters of improper multiferroics under variation of thermodynamic parameters (pressure, temperature).
- Revealing of structural modifications of electrodes of compact electric current sources during charging/discharging processes.
- Determination of magnetic properties and elucidation of nanoscale phenomena in magnetic layered nanostructures in constant and variable magnetic fields.
- Comparative analysis of structural aspects of stabilization of disperse systems and complex liquids with nonmagnetic and magnetic nanoparticles in bulk and interface boundaries.
- Determination of structural characteristics of nanosystems based on compositional C- and Si-containing materials.
- Determination of structural characteristics of magnetic elastomers and carbosilane dendrimers holding promise for technological applications.
- Determination of atomic structure and vibrational spectra of molecular complexes: ionic-molecular inclusive materials and complexes with electric charge transfer, structural and dynamical parameters of hydrogen bonding in bioactive materials.
- Determination of structural and functional characteristics of biological nanosystems.

- Determination of structural characteristics of lipid nanosystems modeling upper skin layer of human and mammal animals in order to study the transport of pharmacological drugs through the skin.
- Determination of regularities of occurrence of instability of rocks under high temperatures and pressures, in particular, during polymorphic phase transition for the development of models of the processes in the earthquake focus.
- Analysis of metamorphic, geodynamic and evolution processes in the lithosphere using the data about the texture of deep and near-surface earth rocks. Exploration of seismic anisotropy origin.
- Development of solid polycrystalline material models for prediction of their elastic, strength and thermal properties taking into account texture, inclusions, pores and microcracks.
- Determination of residual stresses in engineering materials of nuclear reactors, industrial materials and products – composites, reinforced systems, metal ceramics, shape memory alloys.
- Elaboration of radiation damage mechanisms of solid-state materials, obtaining of long-life operating data on radiation resistance of materials.

Realization of the instrument development program for the IBR-2 spectrometers:

- Creation of the final configuration of the DN-6 diffractometer and relevant infrastructure (detector system, mechanical units, set of high-pressure cells, infrastructure for loading pressure cells).
- Creation of the final configuration of the multifunctional reflectometer GRAINS (polarizing system, mechanical part and sample unit).
- Modernization of the available IBR-2 spectrometers (HRFD, YuMO, FSD, REFLEX, REMUR, NERA, SKAT, EPSILON, DIN-2PI) aimed at improving their instrumental parameters (neutron counting rate, background conditions, and extension of experimental opportunities).
- Completion of the reconstruction of the high-intensity DN-2 diffractometer into a real-time diffractometer (RTD).
- Creation of the test configuration of the small-angle spin-echo spectrometer on IBR-2 beamline 9.
- Creation of the basic configuration of the neutron radiography and tomography spectrometer on IBR-2 beamline 14.
- Adaptation of the correlation spectrometer FSS (transported from HZG, Germany, via PNPI) to methodological and research activities on IBR-2 beamline 13.
- Development and testing of neutron scattering methods for condensed matter research including spin-echo, neutron standing waves, neutron magnetic resonance, radiography, tomography, etc.

List of projects:

Project	Leader	Priority (period of realization)

Development of the IBR-2 Facility with a Complex of Cryogenic Neutron Moderators

Leaders:

A.V. Belushkin
A.V. Vinogradov

Participating Countries and International Organizations:

Argentina, Azerbaijan, Belarus, Czech Republic, Japan, Mongolia, Poland, Romania, Russia, Spain, United Kingdom, USA.

Scientific Programme

The theme main task is to increase the efficiency of the use of the IBR-2 facility for realization of the program of experimental investigations, maintenance of operational reliability and safety of the reactor, creation of a complex of cryogenic neutron moderators.

Expected main results in 2017:

- Maintenance of the IBR-2 reactor operation for physical investigations.
- Manufacturing of a reserve movable reflector MR-3R (with the extension of work through 2018).
- Carrying out of experiments, development and construction of new units and equipment, optimization of operating modes on the test stand of the CM-201 cryogenic moderator.
- Step-by-step replacement and upgrading of the technological and electrical equipment in accordance with the Rostekhnadzor license requirements.

Development of Experimental Facilities for Condensed Matter Investigations with Beams of the IBR-2 Facility

Leaders: S.A. Kulikov
V.I. Prikhodko

Participating Countries and International Organizations:

Bulgaria, Czech Republic, France, Germany, Hungary, Republic of Korea, Romania, Russia, Slovak Republic, Ukraine, United Kingdom.

Scientific Programme

Development and construction of a control system of the cryogenic moderator CM-201 for IBR-2 beams № 1, 4, 5, 6, 9.

Design of equipment, electronics and software for the complex of IBR-2 spectrometers; development of the FLNP information and computing infrastructure according to the needs of the Laboratory and the development strategy of the JINR computer network.

Expected main results in 2017:

- Test operation and development of the CM-202 cryogenic moderator systems with a double cryostat and control systems. Experimental studies of radiation and moderating properties of novel advanced materials for cold moderators on the DIN-2PI spectrometer of IBR-2 and radiation research facility. Study and optimization of parameters of the CM-201 moderator on a test stand. Study of radiation resistance of magnetic sensors and detector materials.
- Development and use of the VITESS software package for simulation of reflectometric and GISANS experiments in the modified kinematic approximation; simulation of diffraction and diffuse scattering from multilayer structures with magnetic domains.
- Implementation of the project "Development of PTH sample environment system for the DN-12 diffractometer at the IBR-2 facility" (start-up and adjustment activities: creation of a temperature map for cryostat units with short-circuited current leads at the level of 77 K and 20 K; installation of a magnet in a horizontal position, generation of a magnetic field, measurement of characteristics of the magnet; installation of the cryostat with a sample into the cryostat of the magnet).
- Manufacturing of a monitor 2D PSD for the IBR-2 spectrometers and elements of the ASTRA-M detector system for the FSD spectrometer. Development of a PSD detector with boron convertor, investigation of its characteristics. Assembling and testing of a ring small-angle detector (RTD spectrometer). Equipping of a clean room in bldg. 119.
- Development, manufacturing and adjustment of the prototype of USB-3.0 interface module for MPD-16 electronic units of data acquisition systems of IBR-2 spectrometers. Assembling of 90°-detectors, adjustment of analog and digital electronics, testing of a detector system in different operation modes on the FSS diffractometer. Adaptation of 8-channel digital converter CAEN 6730 for processing data from one- and two-coordinate neutron position-sensitive detectors.
- Putting into operation of the control system of actuators on the basis of Huber goniometer for sample positioning on the FSS diffractometer and the control system of four power sources on the REMUR spectrometer. Design and prototyping of a new control system of the chopper on the basis of a stepper motor.

- Modernization and technical support of the Sonix+ software package, its adaptation to new versions of the software in use. Installation of Sonix+ on the FSS diffractometer. Integration of drivers of new equipment into Sonix+ and development of new programs of the software package at the requests of the users.
- Modernization of outdated network switches in FLNP buildings 42 and 42a for providing data transfer rate of 1 Gbits/s in all LAN nodes. Expansion of WiFi laboratory network.

List of projects:

Project	Leader	Priority (period of realization)
1. Development of PTH sample environment system for the DN-12 diffractometer at the IBR-2 facility	A.N. Chernikov	1 (2015 – 2017)

Multimodal Platform for Raman and Nonlinear Optical Microscopy and Microspectroscopy for Condensed Matter Studies

Leader: G.M. Arzumanyan

Participating Countries and International Organizations:

Armenia, Belarus, Germany, Latvia, Poland, Romania, Russia, France.

Scientific Programme

Experimental studies of condensed matter by Raman, CARS (coherent antiStokes Raman spectroscopy), and SERS (surface-enhanced Raman spectroscopy) spectroscopy and microscopy. Research of structural and optical properties, surface morphology and other characteristics of condensed matter on the multimodal optical platform constructed on the basis of the confocal laser scanning microscope "CARS". Raman spectroscopy is a non-invasive, label-free technique which excites vibrations of molecular bonds. Since optical microscopy is highly valuable to biomedical research, special attention will be given to the spectral-structural studies of various biological samples using coherent and surface-enhanced Raman spectroscopy. Another research direction deals with a study of photo- and upconversion luminescence of optical matrices (glass, glass-ceramics, colloidal nanocrystals) activated by various rare-earth elements.

Expected main results in 2017:

- High contrast nonlinear chemical mapping of biosamples with a signal-to-noise ratio not less than 30:1 in the CARS and SERS options.
- First test-experiments aimed at achieving ultrahigh sensitivity on a single molecule detection level using coherent SERS modality.
- Revealing of molecular compositions and/or conformation changes that can occur in tissues during carcinogenesis or other pathologies.
- Completion of studies on structural and optical properties of transparent matrices based on ZnO nanocrystals codoped with rare earth elements.
- Plasmonic photo- and upconversion luminescence enhancement (not less than one order of magnitude) in phosphors activated with rare earth elements.
- Further development of the multimodal optical platform: utilization of 785nm laser excitation wavelength to suppress the autofluorescence background from samples under study.

List of projects:

Project	Leader	Priority (period of realization)
1. Multimodal platform for Raman and nonlinear optical microscopy and microspectroscopy for condensed matter studies	N. Kučerka Deputy: V.I. Gordeliy	1 (2015 – 2017)

List of activities:

Activity or experiment Laboratory or other Division of JINR	Leaders Main researchers	Status
1. Application of the method of CARS and SERS microscopy aimed at high-contrast chemical selective imaging of various compounds and significant enhancement of the Raman scattering signal from samples under investigation FLNP	G.M. Arzumanyan N. Kučerka V.I. Gordeliy, K.Z. Mamatkulov, N.V. Doroshkevich, K.Sh. Voskanyan	Realization Data taking
2. Development of nanostructured plasmon-enhanced Raman spectroscopy and microscopy method FLNP	G.M. Arzumanyan K.Z. Mamatkulov, N.V. Doroshkevich, E.A. Kuznetsov	Data taking Simulation

Radiation Physics, Radiochemistry, and Nanotechnology Investigations Using Beams of Accelerated Heavy Ions

Leaders:

S.N. Dmitriev
P.Yu. Apel

Participating Countries and International Organizations:

Belarus, Bulgaria, China, Cuba, Czech Republic, Egypt, Germany, Kazakhstan, Moldova, Mongolia, Poland, Romania, Russia, Serbia, Slovak Republic, South Africa, Spain, Ukraine, United Kingdom, USA, Vietnam.

Scientific Programme

Transition to a new level of research and development in the fields of radiation solid state physics, applied radiochemistry and materials science, with a prospect of to nanotechnology applications. The main emphasis will be on the modification of the materials at the nanometer scale and on the study of the effects produced by heavy ions in matter with the aim of revealing the fundamental mechanisms and of the development of nanotechnology applications for ion beams. Modernization of the FLNR facilities for the production of medical isotopes and development of materials modification methods.

Main results expected in 2017:

- Determination of the threshold electronic stopping powers for latent track formation and study of track region morphology in Y-Al, Y-Ti and Ti oxide crystals using high-resolution transmission electron microscopy.
- Study of structural changes induced by heavy ions of fission fragment energy in oxide and carbide nanoparticles in oxide dispersion-strengthened alloys.
- Registration and measurement of structure characteristics of heavy ion latent tracks in polymers using scanning probe tomography.
- Study of effects of high-energy ion bombardment in 2D-materials.
- Study of giant magnetic resistance in metal nanowires obtained using template synthesis in track-etched nanopores.
- Investigation of osmotic phenomena in nanochannels obtained by the track etching technique. Development of a convection-diffusion model for electrolyte transport in track-etched nanopores.
- Development of methods for coating track membranes with SERS-active layers aimed at creation of high-sensitivity membrane sensors.
- Study of mass transport processes under electrical field in hydrophobic nanochannels.
- Application of the method of recoil nuclei for separation and concentration of radioactive isotopes ^{99}Mo (^{99}Tc), ^{225}Ac , ^{236}Np , development of synthesis according to reaction (γ, n) ^{64}Cu , ^{196}Au for nuclear medicine and environmental studies.
- Study of distribution of trace elements and radionuclides of the natural series of U and Th in ecosystems (Mongolia, South Africa).

Research on the Biological Effect of Heavy Charged Particles with Different Energies

Leaders:

E.A. Krasavin
G.N. Timoshenko

Participating Countries and International Organizations:

Armenia, Belarus, Bulgaria, Czech Republic, Egypt, Italy, Moldova, Mongolia, Poland, Romania, Russia, Slovak Republic.

Scientific Programme

Theoretical and experimental research on the biological effect of heavy charged particles with different energies at JINR's basic facilities.

The research and development will include:

- Research on the regularities and mechanisms of the initiation of molecular disorders in the DNA structure and their repair; and radiation-induced apoptosis in human cells under exposure to radiations with different linear energy transfer (LET).
- Decoding of the mechanisms underlying cell hypersensitivity and hyperresistance to low doses of ionizing radiation.
- Acquisition of comparative data on the regularities of the induction of gene and structural mutations in mammalian and lower eukaryote cells by sparsely and densely ionizing radiations with different LET.
- Research on the mechanisms of the induction of retinal damage by heavy charged particles (HCP) and its repair.
- Research on the character of the HCP-induced damage of central nervous system (CNS) cells and regularities of their death. Identification of HCP-induced functional and morphological disorders in the CNS.
- Mathematical modeling of the effects induced by ionizing radiations with different LET at the molecular and cellular levels. Development and analysis of mathematical models of the molecular mechanisms of CNS structural and functional disorders induced by ionizing radiations.
- Calculation of the radiation shielding of new nuclear physics facilities; evaluation of the radiation environment and development of radiation safety systems.

Expected main results in 2017:

- To continue studying regularities in the induction, formation, and repair kinetics of HCP-induced clustered DNA double-strand breaks (DSBs) in human skin fibroblast nuclei.
- To study the expression of the genes encoding the proteins RAD51, DNA PKcs, NBS1, and MRE11, which participate in HCP-induced damage repair in human fibroblasts.
- To continue studying radiation-induced apoptosis mechanisms and different ways of HCP-induced DNA damage repair. To study the expression of the genes that encode the proteins and caspases participating in apoptosis induction in human fibroblasts by HCP.
- Using a Synergy H1m microplate reader, to evaluate the level of the reactive oxygen species and ERK protein kinase in mammalian microglial cells exposed to protons and HCP.

- To continue studying regularities in the induction of gene and structural mutations in yeast cells by radiations with different LET.
- To continue research on the mutagenic effect of ionizing radiations on mammalian cells in the remote after irradiation. To complete a molecular analysis of HPRT-mutant subclones.
- To continue studying the mechanisms behind retina recovery: Mueller cell activation, expression of endogenous protectors in the retina, and expression of the oxidative stress proteins.
- To continue research on the apoptotic death of neurons in different sections of the rat and mouse brain at different times after exposure to radiations with different LET.
- To continue studying disorders in the exchange of monoamines and their metabolites in the prefrontal cortex, hippocampus, striatum, adjoining nucleus, and hypothalamus of the rat brain under exposure to ionizing radiations.
- To continue the development of mathematical models of neurons' functional activity under exposure to radiations with different LET.
- To continue elaboration of model approaches to the quantitative estimation of the relation between the plastic processes in neurons participating in the formation of the brain's functional networks.
- To continue the development of mathematical models of the axon transport of signals.
- To continue testing and calibration of nuclear planetary science instruments with fast neutron generators at the LRB's test site.
- To ensure the conduction of the radiobiological experiments at the Nuclotron (the Laboratory of High-Energy Physics), U-400M cyclotron (the Laboratory of Nuclear Reactions), and the medical beam of the Phasotron (the Laboratory of Nuclear Problems).

Research on Cosmic Matter on the Earth and in Nearby Space; Research on the Biological and Geochemical Specifics of the Early Earth

Leaders:

E.A. Krasavin
A.Yu. Rozanov
V.N. Shvetsov

Participating Countries and International Organizations:

Italy, Norway, Poland, Romania, Russia, United Kingdom, USA.

Scientific Programme

Research and development will include:

- Biogeochemical studies of cosmic dust
- Studies of biofossils and organic compounds in meteorites and ancient terrestrial rocks
- Studies of cosmic matter with nuclear physics methods
- As a result of studying and generalizing the research materials on modern and fossil cosmic dust as well as ancient terrestrial objects and modern organisms of the extreme ecosystems, data will be obtained on the forms of ancient terrestrial and extraterrestrial life.

As the results:

- Obtaining new data on the amount of cosmic matter falling on the whole Earth's surface. Obtaining data on the dynamics of cosmic dust fallout on large territories.
- Evaluation of the following parameters of particles of extraterrestrial origin: morphology, structure, size distribution, and elemental, isotopic, and mineralogical composition. Assessment of changes in these characteristics in different plates in different time intervals.
- Creation of a cosmic dust collection, where dust microparticles will be characterized by quantity (concentration) and the size distribution.
- Obtaining new information on the role of microorganisms in the formation and evolution of life on the Earth and processes of weathering, precipitation growth, etc.
- Research on the synthesis of complex prebiotic compounds from formamide under exposure to ionizing radiations of different qualities with meteorite samples as catalysts.
- Generalization of the obtained data on the forms of ancient terrestrial and, possibly, extraterrestrial life.

Expected main results in 2017:

- To continue the detection and study of biofossils and organic matter in meteorites and the most ancient terrestrial rocks.
- To continue the diagnostics of microorganism remnants in Archaean and Proterozoic rocks and evaluation of their organization level with nuclear physics methods.
- To continue research on the synthesis of complex prebiotic compounds from formamide under exposure to accelerated ions with different linear energy transfer.
- To study the nature of the catalysts participating in the synthesis of complex prebiotic compounds from formamide.

Biomedical and Radiation-Genetic Studies Using Different Types of Ionizing Radiation

Leader: G.V. Mitsyn
Deputy: S.V. Shvidky

Participating Countries and International Organizations:
 Czech Republic, India, Poland, Romania, Russia.

Scientific Programme

Medico-biological and clinical research for the proton radiotherapy of cancer patients. Formation of experimental data base in the field of radiation mutagenesis in the animal germ cells.

Expected main results in 2017:

- Continuation of clinical researches on proton therapy of cancer patients in Room 1. Evaluation of the effectiveness of the conducted radiation treatment of different neoplasms.
- Work to increase the functional capability of the developed 3D treatment planning software and its clinical tests in the treatment sessions.
- Test of the prototype equipment for the dynamic conformal irradiation of deep-seated tumours with the proton beam.
- Development and improvement of detectors and tools for the clinical dosimetry of the medical hadron beams.
- Exploration of the possibilities of laser radioprotection against damage after exposure to ionizing radiation on mouse fibroblast cells with the application of laser module with a wave length of 532 nm.
- Investigations of the molecular spectra of gene mutations induced by different quality ionizing radiation in animal germ cells.

Novel Semiconductor Detectors for Fundamental and Applied Research

Leader: G.A. Shelkov
Deputy: A.S. Zhemchugov

Participating Countries and International Organizations:

CERN, Czech Republic, Germany, New Zealand, Poland, Russia, South Africa, Ukraine.

Scientific Programme

Generic R&D of semiconductor radiation-resistant detectors based on new materials and of hybrid pixel detectors with high resolution for nuclear and particle physics. Development of the research infrastructure for semiconductor detector R&D, coupled with beam tests at the JINR facilities, to be used by groups from JINR and from the Member States. Scientific collaboration with research groups from other fields in feasibility studies of application of the newly developed detectors in others areas of science and technology (primarily in medicine and geology). Research in condensed matter physics using the method of positron annihilation spectroscopy (PAS). Development of a PAS method on the beam of monochromatic positrons, the creation of equipment for spectroscopy by the Doppler method of measuring the lifetime of positrons in matter.

Expected main results in 2017:

- Systematic studies of radiation hardness and response of GaAs detectors in the beams of the JINR facilities.
- Production of prototypes of Timepix hybrid pixel detectors with GaAs sensor of thickness less than 1 mm. Study of their capabilities in detecting neutrons, fission fragments and charged tracks.
- Production of a prototype of the low-background GaAs-based hybrid pixel detector for TGV-2.
- Study of X-ray contrast media identification by spectral data.
- MARS-CT calibration and image processing aimed at geophysics studies.
- Test of the block of registration for an electromagnetic calorimetry.
- Project preparation about use of new semiconductor photodetectors in a calorimetry for high energy physics.
- Commissioning of the slow monochromatic positrons cryogenic source, construction of the closed autonomous cooling system and the emitter-source of the activity of 30 mCi.
- The construction and commissioning of the specialized monochromatic positron channel (SMPC) and the experimental station. Start of research by Doppler method.

Information and Computing Infrastructure of JINR

Leader: V.V. Korenkov
Deputy: T.A. Strizh

Participating Countries and International Organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, CERN, China, Cuba, Czech Republic, Egypt, France, Georgia, Germany, Italy, Kazakhstan, Moldova, Mongolia, Poland, Romania, Russia, Slovakia, South Africa, Sweden, Taiwan, Ukraine, USA.

Scientific Programme

The purpose of the theme is to ensure the further development of the network, information and computing infrastructure of JINR for the research and production activities of the Institute and its Member States on the basis of state-of-the-art information technologies in accordance with the JINR Seven-Year Plan of development. A particular area within the theme is the development of the Multifunctional information and Computing Complex (MICC) at LIT JINR presented in a Project form.

Expected main results in 2017:

- Modernization and increase of reliability of the central telecommunication node of the Institute's IT infrastructure, provision of the reliable operation of the JINR local network. A gradual transition of the JINR Backbone to 100 GBps.
- Modernization of the power supply system and uninterrupted power supply, air-conditioning and ventilation, fire safety complex and engineering infrastructure of MICC.

The introduction and use of new data transfer protocols, upgrade of the e-mail service, the development of the WiFi authorization service, designing of the "Personal Cabinet" service.

Increase of performance and storage capacity of the base grid component MICC – Tier-1 centre for the CMS experiment at JINR.

The extension of the computing resources and data storage systems which are part of the integral component Tier-2/CICC: 37% for processor capacity and 10% - for disk storage.

Increasing of the computing power of both a multi-core component of the HybriLIT cluster comprising multicore processors and co-processors Intel Xeon Phi, and a GPU component containing computation accelerators Nvidia. Increase in computing resources and disk storage HybriLIT up to 90 Tflops and 20 TB, respectively.

Growth of the cloud component capacity - increase in the number of cores up to 1400, memory – up to 6160 GB and disc storage - up to 576 TB.

The creation of a prototype for transferring the monitoring system to a new Icinga2 core and migration of the monitoring system to a new Icinga2 core. Commissioning of a new service monitoring system and analyzing of a possibility of events prediction.

The creation of the element of the LIT cluster for processing up to 0.5 PB and storing up to 1 PB data per year using the available resources for the computer off-line complex of data handling for the NICA project. Designing of the MICC computing component for NICA. Simulation of the computing centre for NICA in order to determine a required equipment configuration.

- Implementing a final stage of activities on transition of self-sustaining units to work in the system 1C UPP 8.3; integration of the 1C UPP system and subsystem Gateway (data bus); analysis of the special features and functionality of the platform 1C:ERP Enterprise Management 2, preparation for the transition from 1C UPP 8.3 to the platform 1C:ERP.

The completion of the implementation of a universal gateway for data exchange between different CIS subsystems.

The development of a multi-project version of the JINR corporate project management system (JINR CPMS) on the basis of a control system of the NICA project (APT EVM for NICA).

The development and functional implementation of the automated configuration, monitoring and control of the process of documents approval within the electronic document management system "EDMS Dubna".

The installation of a single window system: designing a Personal Cabinet system that provides end users with access to their personal information and implements a unified entry point to CIS; development of a web-portal to access a catalogue (a set of references) of the existing (ADB2, PIN, Indico, PM, HelpDesk, etc.) and future services; the development of detailed requirements for integration of the CIS subsystems with a single point of authorization and a database of the Personal Cabinet of JINR users.

- Training courses (tutorials) on distributed, cloud, and parallel programming technologies on the basis of the educational and research grid-infrastructure and the heterogeneous cluster 'HybriLIT': regular training courses on advanced IT technologies both for the JINR staff members and for students and young scientists from JINR Member States in frames of the practical courses organized by the JINR UC; special courses of the leading software developers; special courses and seminars in frames of conferences and schools organized by JINR; special courses in the JINR Member States in frames of programs for international cooperation.

Methods, Algorithms and Software for Modeling Physical Systems, Mathematical Processing and Analysis of Experimental Data

Leaders:

Gh. Adam
P.V. Zrelov

Participating Countries and International Organizations:

Armenia, Australia, Azerbaijan, Belarus, Belgium, Brazil, Bulgaria, Canada, CERN, China, Czech Republic, France, Georgia, Germany, Greece, India, Italy, Japan, Kazakhstan, Moldova, Mongolia, Poland, Portugal, Romania, Russia, Slovakia, South Africa, Switzerland, Taiwan, Tajikistan, USA, Vietnam.

Scientific Programme

Carrying out paramount advanced research in the field of computational mathematics and computational physics, directed to the creation of new mathematical methods, algorithms, and software for the numerical or symbolic-numerical solution of topics arising in experimental and theoretical studies, by using the newest computational tools, primarily the heterogeneous cluster HybriLIT. This subject area includes a wide spectrum of investigations underway at JINR in high energy physics, nuclear physics, condensed matter physics and nanotechnologies, biophysics, information technologies, etc., which demand the development of new mathematical methods and approaches for modeling physical processes, processing and analysis of experimental data, including the use of these studies in the NICA project, the neutrino programme and other strategic goals of the Institute. A distinctive feature of these investigations is the close cooperation of LIT with research groups from all the JINR laboratories and from Member State institutions.

Expected main results in 2017:

- The development of effective QCD-motivated models for describing properties of nuclear matter at NICA energies, computer simulations of the behavior of the critical points at the QCD phase diagram.

Three-dimensional computer modeling of the magnetic field distribution in the superconducting magnets for NICA and SIS100 (FAIR).

Development of methods of investigation of the dimesoatom formation in processes of multiple particle production at high energies including the coherent birth of long lived nP states of $\pi^+\pi^-$ atoms.

Study within the microscopic optical potential model of the mechanisms of various nuclear processes, including pre-equilibrium processes in the reactions $(p,\alpha)^{59}Co$ at energies from 65 to 160 MeV, disintegration processes in the interactions of boron isotopes and other exotic nuclei with protons and nuclei, the inelastic interaction of pions with nuclei at (33) -resonance energies.

Development and maintenance of the primary data processing program SAS for the YuMO spectrometer at IBR-2. Implementation of data processing for the position sensitive detectors for isotopically scattering samples.

Numerical analysis of properties of Bose condensates with nonlocal interaction potentials.

Development of methods for numerical investigations of structures and bifurcation regimes in non-linear models of condensed matter physics.

Mathematical modeling of beam dynamics for multipurpose isochronous cyclotrons.

Development of methodology, algorithms and programs for digital processing of arbitrary plane curves with the aim to obtain their analytic forms.

Bayesian automatic adaptive quadrature with scale dependent quadrature sums.

Numerical solution of boundary value problems for the nonlinear Boltzmann-Poisson equations describing the interaction of protein macromolecules with the solvent.

Study of the applicability of fractal analysis methods for processing and systematization of the results of molecular dynamics simulations of the interaction of nanocluster beams with thin metal films.

Development of algorithms and software for predictive analysis and forecasting parameters of the IBR-2M reactor (fluctuations of the pulse energies, the flow of liquid sodium through the core, etc.).

- Development and support of Glauber Monte Carlo program as well as adaptation of Geant4 FTF model for NICA/MPD and CBM experiments.

Development of the dataflow control system in the experiments of the NICA project.

Processing and analysis of data collected at the NUCLON experiment.

Software support of ATLAS experiment (maintenance of the TDAQ components previously developed in LIT; new developments: network monitoring dashboard, online TDAQ Log Manager)

Software development for the GEM tracking detector entering the detector complex of the BM@N experiment (development of algorithms and software for the simulation of realistic data with the microstrip GEM camera; development and software implementation of algorithms for the reconstruction of the spatial coordinates of the points of interaction of the charged particles with the registering elements of the GEM detector; software implementation of GEM detector models for the foreseen configurations planned in the upcoming sessions of the BM@N experiment).

BM@N: Event reconstruction with 2016-2017 Nuclotron data; development of algorithms and programs for the particle trajectories recognition in the MPD setup.

CMS: CSC local reconstruction improvement with high luminosity LHC data.

Development of VMRIA package for the automatic analysis of large spectra collected in experiments carried out on HRFD at IBR-2.

Development of methods for automatic analysis of gamma spectra and software for automatic calibration of low statistics gamma spectra.

Development and adaptation of methods of data analysis to the conditions of small statistics and incomplete observations (estimated half-lives).

Development of methods based on the generalized separate form factor model, for the analysis of experimental data of small angle neutron and synchrotron radiation on vesicular polydisperse nano-systems.

Adaptation of the algorithm L1 – recognition and track reconstruction of charged particles, based on the application of cellular automata, for the detector MVD of the CBM experiment.

Development of a system of testing and quality evaluation for the time-oriented clustering algorithms and the hit search and its software implementation for the STS detector of the CBM experiment.

Visualization of the procedure of the track reconstruction of charged particles in the MUCH detector of the CBM experiment.

Development of selection criteria of the rare decays $J/\psi \rightarrow \mu^+\mu^-$ using data from within the coordinate planes of the MUCH detector. Development of algorithms for recognition and reconstruction of rare decays of light vector mesons, $J/\psi \rightarrow e^+e^-$, recorded in the CBM experiment.

Vectorization and parallelization of the trajectory reconstruction algorithm of the charged muons registered by the MUCH detector.

Analysis of RICH detector data obtained in a test experiment at CERN. Software development for simulation and reconstruction of events recorded by the RICH detector. Optimization of the geometry of the RICH detector. Software development of the data acquisition system (DAQ) and of the software interface between the DAQ and CBMRoot for the RICH detector online analysis.

Development, optimization and testing of algorithms for the event processing system FLES on multicore servers at LIT. Inclusion of the 4D-reconstruction time slices in CBMROOT. Study of the problem of possible event cleavage in the border areas between neighboring time slices.

Development of a database system for the CBM experiment: 1) implementation of component-wise database adapted to the features of the various detectors of the CBM facility; 2) implementation of the structure of the geometric database.

Development of methods and algorithms for massive calculations of electrostatic potentials of molecules of DNA, RNA and protein factors, as well as maps of the surface of these biopolymers. Calculation at the HybriLIT cluster of electrostatic potentials and surface maps of biopolymer molecules enabling solutions of biomolecular recognition problems.

Generation of random rough surfaces to simulate features of diffraction patterns at neutron reflection from the surface of nanostructured objects.

- Development and maintenance of the information-computing environment of the heterogeneous cluster HybriLIT.

Development of algorithms for numerical investigation of multi-dimensional models of evolutionary equations modeling physical processes in different materials under irradiation with heavy ions and pulsed beams, Josephson barriers in high-temperature superconductors. Their code implementation for computations on HybriLIT.

Development of efficient algorithms for the solution of molecular dynamics equations on hybrid computing infrastructures.

Development of methods and MPI packages for the computation of multiple integrals for the study of processes of ionization and photoionization of the He atom, polyatomic molecules, and their ions.

Development and implementation of new parallel algorithms into the MCTDHB software complex and their adaptation to the new KNL architecture of the Intel Xeon Phi.

Development and maintenance of the Fitter program, including implementation of its parallel version.

HybriLIT devoted optimization of selected programs of the ROOT software package, in particular, improvement, using technologies of parallel computing, of the software implementation of the filling algorithms of the special data structure Tree.

Elaboration of effective algorithms for solving elliptic nonlinear hp-adapted finite-element systems of equations and their program implementation on heterogeneous architectures.

Adaptation of the multibranch solutions of the Tolman-Oppenheimer-Volkov system of equations to hybrid computing architectures.

Set up, testing and validation of different modules of Comsol Multiphysics® package and of the "CATIA-GDML Geometry Builder" complex on the cluster HybriLIT and their adaptation for solving engineering-physical problems in JINR laboratories.

- Development and investigation of a new model of quantum networks with memory function.

Description of separable and entangled X-states of two-qubit systems.

Calculation of relativistic corrections in the description of dynamics of spin particles in strong laser fields (for project ELI-NP, Romania).

Derivation, based on unitary representations of finite groups, of combinatorial algorithms and algorithms of statistical modelling of quantum systems.

Creation of a symbolic-numerical package implementing the finite element method with associated Hermite polynomials for the solution of equations describing the dynamics of low-dimensional few-particle quantum systems. Adaptation of the developed algorithms and codes to hybrid architectures.

Algorithmic construction of difference schemes inheriting the basic algebraic properties of the initial differential equations.

Computation of the renormalization constants for the two-loop propagator of quark mixtures.

Design and implementation of algorithms for computation of rotational-vibrational basis functions in the space of parameters describing quadrupole and octupole deformation of spherical nuclei.

Implementation in Lucid Common Lisp of the computer algebra system Reduce with a convenient user interface toward libraries of numerical programs.

**Analytical and Methodological Work to Assess the Prospects
of Scientific Research and Cooperation in the Main Directions
of JINR's Development.
Organization of International Cooperation**

Leader: N.A. Russakovich

Participating Countries and International Organizations:

Member States of JINR, non-Member States participating in JINR activities on the basis of bilateral agreements, and international organizations.

Scientific Programme

Preparation by the JINR Science Organization Department of analytical materials on the prospects of scientific research. Preparation of research plans. Preparation of scientific-organizational and methodological materials concerning special-purpose financing of research areas, themes and projects. Application of data base systems for the analysis of results of theoretical and experimental research activities. Organization of international cooperation with the Member States of JINR, non-Member States participating in JINR activities on the basis of bilateral agreements, and with scientific research institutions with which JINR has collaboration agreements.

Expected main results in 2017:

- Analysis of the results of JINR activities in the main directions of research. Preparation for publication of the JINR Topical Plan for Research and International Cooperation for 2018.
- Information and technical preparation of the JINR Web site. Support of the electronic system of protocols for scientific and technical collaboration.
- Preparation for publication of JINR Annual Reports Preparation of materials for the INIS system.
- Maintenance of interaction with representatives of the JINR Member States and non-Member States participating in JINR activities on the basis of bilateral agreements in the field of scientific research. Organization and holding of meetings of the Cooperation Committees. Maintenance of JINR's interaction with international organizations.

Organization, Support and Development of the JINR Educational Programme

Leaders:

V.A. Matveev
S.Z. Pakuliak

Participating Countries and International Organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, CERN, Czech Republic, Egypt, Kazakhstan, Moldova, Poland, Romania, Russia, Slovakia, South Africa, Ukraine, USA.

Scientific Programme

Support and development of the JINR Educational Programme in general (training of physicists and engineers in JINR fields of research and in the interest of the Member States). Further professional development, training and retraining of JINR engineering and technical staff. Promotion of physics research and of the Institute activities among the youth of the Member States including high-school students, university students, and school teachers.

Expected main results in 2017:

- Support and maintenance of the educational process at JINR-based departments of Russian universities. Preparation and publication – as tutorials – of lectures given to the students and postgraduates at the UC. Support of the system of assigning young researchers to JINR laboratories for preparation of PhD theses without mastering the academic programmes of PhD courses.
- Organization and running of Summer Students Practices in JINR fields of research for students of higher-education institutions of JINR Member States. Participation in the organization and running of international schools on nuclear physics and particle physics for young scientists. Expansion of the research projects of the Summer Student Programme at JINR and the number of participants of this programme.
- Development of the training facilities for practice in the framework of a UC-based scientific and engineering group for the fulfilment of the educational programmes on training qualified specialists for the needs of JINR and other scientific centres of the Member States.
- Cooperation with international foundations in organizing student and postgraduate exchange between the UC and foreign research centres regulated by special agreements.
- Development of the computer infrastructure for organizing and conducting training programs for data analysis in high-energy physics experiments and for the design of modern physical facilities.
- Improvement of the training laboratory and inter-school elective courses for the organization of lecture courses and practical classes in physics for high-school students from Dubna and the Member States. Organization of scientific schools for teachers of physics from the Member States at CERN and JINR.
- Organization of real and virtual excursions to JINR and video-conferences for high-school students and teachers from the Member States. Development of the system of teaching Russian, English, French, and German to JINR staff.
- Development of training and educational programmes in nuclear and particle physics. Dissemination of information on the Virtual Laboratory of Nuclear Fission in the Member States.
