Outline

Em. current correlator in-medium approaches

Em. current correlation function and dileptons

- dilepton thermal emission rates given by same electromagnetic-current-correlation function ($J_\mu = \sum_f Q_f \bar{\psi}_f \gamma_\mu \psi_f$)

[McLerran+Toimela (1985), Weldon (1990), Gale+Kapusta (1991),...]

$$\Pi^{<}_{\mu\nu}(q) = \int \mathrm{d}^4 x \exp(\mathrm{i} q \cdot x) \left\langle J_\mu(0) J_\nu(x) \right\rangle_T = -2 f_B(q \cdot u) \operatorname{Im} \Pi^{(\text{ret})}_{\mu\nu}(q)$$

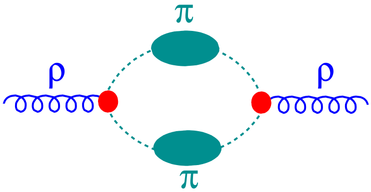
$$\frac{\mathrm{d}N_{e^+e^-}}{\mathrm{d}^4 x \, \mathrm{d}^4 q} = -g^{\mu\nu} \frac{\alpha^2}{3 q^2 \pi^3} \operatorname{Im} \Pi^{(\text{ret})}_{\mu\nu}(q) \Big|_{q^2 = M^2_{e^+e^-}} f_B(q \cdot u)$$

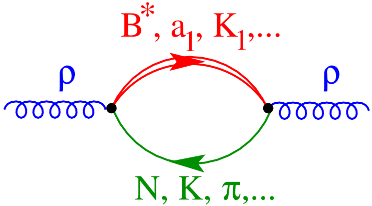
- u: four-velocity of the fluid cell; $p \cdot u = p_0^{\text{hb}}$ energy in “heat-bath frame”
- to lowest order in α: $e^2 \Pi_{\mu\nu} \simeq \Sigma^{(\gamma)}_{\mu\nu}$
- vector-meson dominance model:

$\Sigma^{\gamma}_{\mu\nu} =$ 
- need in-medium spectral functions of vector bosons
- additional sources: QGP, “multi-pion” processes

Hadronic many-body theory

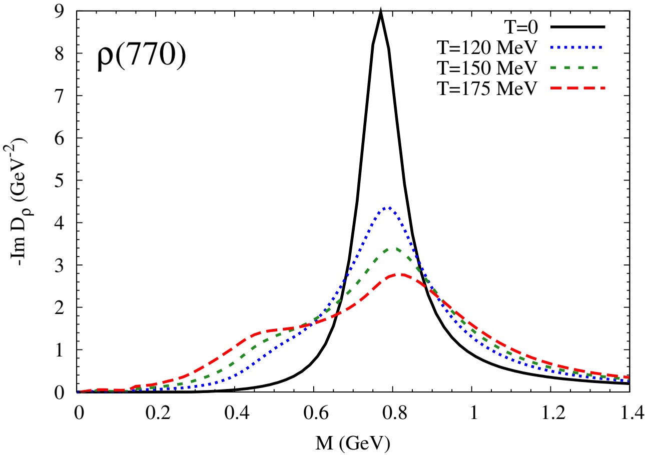
- HMBT for vector mesons [Ko et al, Chanfray et al, Herrmann et al, Rapp et al, ...]
- $\pi\pi$ interactions and baryonic excitations





- +corresponding vertex corrections ⇔ gauge invariance
- Baryon (resonances) important, even at RHIC with low **net** baryon density $n_B - n_{\bar{B}}$
- reason: $n_B + n_{\bar{B}}$ relevant (CP inv. of strong interactions)

In-medium spectral functions and baryon effects



[R. Rapp, J. Wambach Adv. Nucl. Phys **25**, 1 (2000), R. Rapp, J. Wambach, HvH,Landolt-Börnstein I/23, 4âĂŞ1 (2009), arXiv: 0901.3289 [hep-ph]]

- baryon effects important
  - large contribution to broadening of the peak
  - responsible for most of the strength at small M

Coarse-grained UrQMD

(with S. Endres, J. Weil, M. Bleicher)

Coarse-grained UrQMD (CGUrQMD)

- problem with medium modifications of spectral functions/interactions
- only available in equilibrium many-body QFT models
- use "in-medium cross sections" naively: double counting?!?
- way out: map transport to local-equilibrium fluid
- use ensemble of UrQMD runs with an equation of state
- fit temperature, chemical potentials, flow-velocity field from anisotropic energy-momentum tensor [W. Florkowski et al NPA **904-905**, 803c (2013)]

$$T^{\mu\nu} = (\epsilon + P_\perp) u^\mu u^\nu - P_\perp g^{\mu\nu} - (P_\parallel - P_\perp) V^\mu V^\nu$$

- thermal rates from partonic/hadronic QFT become applicable
- extrapolated lattice QGP and Rapp-Wambach hadronic many-body theory
