## Implications from $\boldsymbol{B} \rightarrow \mathbb{K}^{*} \ell \ell$ abservables using $L H C B$ data

Rahul Sinha

The Institute of Mathematical Sciences
Chennai India

Helmholtz International Summer School
"Quantum Field Theory at the Limits: from Strong Fields to Heavy Quarks" July 18-30, 2016, JINR, Dubna RUSSIA

## Outline

1. Why search New Physics through heavy flavor.
2. Complications in studying heavy flavor decays. Operator product expansion and effective Hamiltonian.
3. $B \rightarrow V V$ and introduction to angular analysis.
4. Why B $\rightarrow K^{*} \ell^{+} \ell^{-}$?
5. Amplitude for $\boldsymbol{B} \rightarrow K^{*} \ell^{+} \ell^{-}$, non-local contributions and hadronic matrix elements.
6. Angular analysis in $B \rightarrow K^{*} \ell^{+} \ell^{-}$.
7. Observables in $B \rightarrow K^{*} \ell^{+} \ell^{-}$.
8. Effect of non-local contributions.
9. Techniques for low $q^{2}$ and high $q^{2}$.
10. Various approaches to clean observables $P_{i}^{(\prime)}$.
11. Our own approach to clean observables...

My apologies for the patchy referencing. Happy to add citations. Hopefully update these lectures in near future. Correct typos and add references.

## Why study B decays?

SM is a gauge theory capable in principle of explaining interactions between the observed particles. All ingredients completed by 1974. Soon there were attempts to go beyond. In fact even before SM could be tested attempts were made to extend it. Many arguments were given to go beyond

- Too many parameters-No fundamental understanding of masses, mixing \& CP violation
- Existence of a fundamental scalar: Naturalness Problem: Higgs mass is unstable to radiative corrections. One-loop correction to Higgs boson mass due to quantum fluctuations of a size characterised by the scale $\Lambda_{N}$ are $\delta M_{H}^{2} \approx \alpha \Lambda_{N}^{2}$ If we require $\delta M_{H}^{2} \lesssim M_{H}^{2} \Rightarrow \Lambda_{N} \simeq 1 \mathrm{TeV}$.
- Strong reason to believe that there exists dark matter and dark energy. Observable Universe only 5\%.
- Gravity is not included ...

Many model and attempts have been made to extend SM

- Technicolor
- Grand Unified Theories
- Supersymmetry
- Extra dimensions
- Little Higgs, ...

However, no conclusive signal of physics beyond the SM has been seen in last 40+ years. How does one see a signal of New Physics?

New Physics can be discovered either by

- direct production of new particles ait high energies
- indirect searches at high luminosity facilities. New physics can contribute virtually to loop processes.

## 1. Collider Signals <br> 2. Precision tesis and rare decays

$\mu$ magnetic moment
At $\left(\frac{a}{\pi}\right)^{4} 891$ Feynman diagrams $a_{\mu}=116592089$ (63) $\times 10^{-11}$ (Exp) $a_{\mu}=116591840(59) \times 10^{-11}(\mathrm{SM})$ $a_{\mu}=6949.1(37.2)(21) \times 10^{-11}($ hadronic $)$

## New Physics: flavour physics perspective

- Why are there 3 generations of quarks and leptons? Flavour problem
- The amount of CP violation observed is too small for Baryogenesis.

$$
\frac{n_{B}-n_{\bar{B}}}{n_{Y}} \approx 10^{-20} \text { in } S M, \text { but } \sim 6 \times 10^{-10} \text { is needed. }
$$

- CP violation is observed phenomenon the origin of which have to be better understood.
- To explain the CKM elements, understand what makes quarks and lepton elements so different.
- New Physics must satisfy FCNC constraints.

New physics modifies low energy effective Hamiltonian:

- Cause new contributions to the SM operators.
- Generate new operators.
- Lead to new CP violating phases.

## NP cannot show up everywhere.

Where should one, then, look for NP? The obvious rules are to look for observables that are:

- Easy to measure, so that there is no large systematics or backgrounds to deal with.
- Have a small SM (theory) uncertainty.
- Sensitive to NP, so that NP signals are seen with the least numbers of B or D mesons.
Loop level processes that are easy to calculate or we should smartly be able to remove SM uncertainty.

New physics modifies low energy effective Hamiltonian:

- Cause new contributions to the SM operators.
- Generate new operators.
- Lead to new CP violating phases.

## NP cannot show up everywhere.

Where should one, then, look for NP? The obvious rules are to look for observables that are:

- Easy to measure, so that there is no large systematics or backgrounds to deal with.
- Have a small SM (theory) uncertainty.
- Sensitive to NP, so that NP signals are seen with the least numbers of B or D mesons.
Loop level processes that are easy to calculate or we should smartly be able to remove SM uncertainty.

## Decays of the B mesons

Color Suppressed Tree C

$$
d, u, s, c
$$

Penguin $\mathbf{P}$

$$
d, u, s, c
$$

Electroweak Penguin $\mathbf{P}_{\mathbf{E W}}$

Weak decays of hadrons are actually weak interaction of their constituent quarks.

Penguin Annihilation PA

$d, u, s, c$

Exchange E

More smaller contributions

## Operator product expansion

a) Hadrons are complicated superposition of an infinite no of short lived quark and gluon configuration.
b) The weak interaction time is considerably shorter than the typical lifetime of these fluctuations because of the large mass of the gauge boson $W$.
c) These strong interaction processes can be divided in long and short distance phenomena by the momentum scales involved. The long distance effect happen at distances of usual hadrons size which include bound state wave functions, soft gluon radiation and final state interactions. On the other hand, short distance effects originates in hard gluon interaction.
d) All long distance effects are absorbed in the initial and final hadronic wave functions whereas short distance corrections are associated with the effective weak Hamiltonian $\mathcal{H}_{\text {eff }}$.
e) Correspondingly, the weak amplitudes are given by matrix elements of $\mathcal{H}_{\text {eff }}$ between asymptotic states

## Hierarchy of scalles

$$
\underbrace{\Lambda_{\text {QCD }}^{10^{-4} T e V}}_{\text {Long distances }} \ll \underbrace{\Lambda_{\mathrm{EW}}}_{\text {Short distances }} \ll \underbrace{\Lambda_{0^{-1} T e V}^{\Lambda_{\mathrm{NP}}}}_{\text {Very short distances }} \ll \underbrace{10^{0} T e V}_{\mathrm{NP}^{0} T e V}
$$

Lot of effort put into understanding these decays. The technique utilized to address this is Effective Field Theory. It allows one to look at the physics of the shortest distance/time scales ignoring the longer ones, and then move sequentially to longer distances/times.

- Heavy degrees of freedom (new physics particles, top, Z, W) are integrated out from appearing explicitly $\rightarrow$ short-distance loop functions. Renormalization group allows summation of large $\log \left(\mu_{S D} / \mu_{L D}\right)$.
- Long distance effects involve calculation of matrix elements of local quark bilinear operators. Form factors...

In SM the effective Hamiltonian for $b \rightarrow s \ell^{+} \ell^{-}$is given by

$$
\mathcal{H}_{\mathrm{eff}}=\frac{G_{F}}{\sqrt{2}}\left(\sum_{i=1}^{2}\left(\lambda_{u} C_{i} \mathcal{O}_{i}^{u}+\lambda_{c} C_{i} \mathcal{O}_{i}^{c}\right)-\lambda_{t} \sum_{i=3}^{10} C_{i} \mathcal{O}_{i}\right)
$$

$$
\text { Unitarity } \lambda_{u}+\lambda_{c}+\lambda_{t}=0 \quad \lambda_{i} \equiv V_{i s}^{*} V_{i b}
$$

$$
\mathcal{O}_{1}^{q}=\left(\bar{s}_{i} q_{j}\right)_{V-A}\left(\bar{q}_{j} b_{i}\right)_{V-A} \quad \mathcal{O}_{2}^{q}=(\bar{s} q)_{V-A}(\bar{q} b)_{V-A}
$$

$$
\mathcal{O}_{3}^{q}=(\bar{s} b)_{V-A} \sum_{q}(\bar{q} q)_{V-A} \quad \mathcal{O}_{4}^{q}=\left(\bar{s}_{i} b_{j}\right)_{V-A} \sum_{q}\left(\bar{q}_{j} q_{i}\right)_{V-A}
$$

$$
\mathcal{O}_{5}^{q}=(\bar{s} b)_{V-A} \sum_{q}^{q}(\bar{q} \boldsymbol{q})_{V+A}
$$

$$
\mathcal{O}_{6}^{q}=\left(\bar{s}_{i} b_{j}\right)_{V-A} \sum_{\rho^{2}}^{q}\left(\bar{q}_{j} q_{i}\right)_{V+A}
$$

$$
\mathcal{O}_{7}^{q}=-\frac{e m_{b}}{8 \pi^{2}} \bar{s}_{i} \sigma_{\mu \nu}^{q}\left(1+\gamma_{5}\right) b_{i} F^{\mu \nu}
$$

$$
\mathcal{O}_{9}^{q}=\frac{e^{2}}{8 \pi^{2}}(\bar{s} b)_{V-A}(\bar{\ell} \ell)_{V}
$$

$$
\mathcal{O}_{8}^{q}=-\frac{g m_{b}}{8 \pi^{2}} \bar{s}_{i} \sigma_{\mu \nu}\left(1+\gamma_{5}\right) T_{i j}^{a} b_{j} G^{\mu \nu}
$$

$i$ and $j$ are color indices $\quad m_{b}$ running $b$-quark

$$
\mathcal{O}_{10}^{q}=\frac{e^{2}}{8 \pi^{2}}(\bar{s} b)_{V-A}(\bar{\ell} \ell)_{A}
$$ $g(e)$ strong (e.m) couplings mass in $\overline{M S}$ scheme

$$
(\bar{s} b)_{V \pm A}=\bar{s} \gamma_{\mu}\left(1 \pm \gamma_{5}\right) b
$$

## $B \rightarrow V_{1} V_{2}$ and angular analysis

$\rightarrow$ B decays to two vector mesons special due to the presence of 3 helicity amplitudes

$$
\begin{array}{ccc}
\text { Spin } J=0 \\
\text { both have Spin } 1
\end{array} \underset{L=0,1,2 \text { or } S, P, D \text { waves }}{B \rightarrow V_{1} V_{2} \quad V_{1} \text { and } V_{2}}
$$

$\rightarrow$ In the rest frame of $B$, the momenta of $V_{1}$ and $V_{2}$ are equal and opposite hence the helicities of both the vector mesons are same.
$\rightarrow C P$ of a final state depends on the partial wave: $(-1)^{L} \Rightarrow$ final state admixture of CP-odd and CP-even. Since asymmetry has opposite sign for the two CP states one has cancellation or dilution of overall asymmetry. Separation of CP-even and CPodd components needed.

## - POLARIZATION IN $B^{0}$ DECAY

$\Gamma_{L} / \Gamma$ in $B^{0} \rightarrow J / \psi(1 S) K^{*}(892)^{0}$

$\rightarrow$ Need to perform angular analysis to obtain the helicity amplitudes from expt. data. Already been done for several B $\rightarrow$ $V_{1} V_{2}$ decay modes.
$\rightarrow$ Three different angular momentum projections that are used
$>$ Helicity basis
> Transversity basis
> Partial wave decomposition

- Theses bases are equivalent; different basis states have different physical interpretation giving different physical insights about the underlying processes.
$\rightarrow$ The most general covariant amplitude for a $B \rightarrow V V$ e.g. $B \rightarrow D^{*} \rho$ $A\left(B(p) \rightarrow V_{1}\left(k, \epsilon_{1}\right) V_{2}\left(q, \epsilon_{2}\right)\right.$

$$
=\epsilon_{1}^{\mu} \epsilon_{2}^{v}\left(a g_{\mu \nu}+\frac{b}{m_{1} m_{2}} p_{\mu} p_{v}+i \frac{c}{m_{1} m_{2}} \epsilon_{\mu \nu \alpha \beta} k^{\alpha} q^{\beta}\right)
$$

Consider decay of vector $V\left(\epsilon_{\mu}\right)$ to two pseudoscalars. In the rest frame this is described by

$$
\begin{aligned}
\epsilon= & (0, \vec{\epsilon}), p_{1}=\left(\sqrt{m_{1}^{2}+\vec{p}^{2}}, \vec{p}\right), p_{2}=\left(\sqrt{m_{2}^{2}+\vec{p}^{2}},-\vec{p}\right) \\
\mathcal{M}\left(V\left(\epsilon_{\mu}\right)\right. & \left.\rightarrow P_{1}\left(p_{1}\right) P_{2}\left(p_{2}\right)\right) \\
& \propto \epsilon_{\mu}\left(p_{1}-p_{2}\right) \propto \vec{\epsilon} \cdot \vec{p}
\end{aligned}
$$

Momentum of pseudoscalar mesons is peaked along the polarization direction

$$
\begin{aligned}
A_{L} & =-x a-\left(x^{2}-1\right) b \\
A_{\|} & =\sqrt{2} a \\
A_{\perp} & =\sqrt{2}\left(x^{2}-1\right) c \\
A(B & \left.\rightarrow V_{1} V_{2}\right)
\end{aligned}
$$

$\propto\left(A_{L} \cos \theta_{1} \cos \theta_{2}+\frac{A_{\|}}{\sqrt{2}} \sin \theta_{1} \sin \theta_{2} \cos \phi+i \frac{A_{\perp}}{\sqrt{2}} \sin \theta_{1} \sin \theta_{2} \sin \phi\right)$
$A_{0}, A_{\|}$and $A_{\perp}$ referred to as the transersity amplitudes
Helicity amplitudes are defined as $H_{0}, H_{+}, H_{-}$, where

$$
H_{ \pm}=\frac{1}{\sqrt{2}}\left(A_{\|} \pm A_{\perp}\right), H_{0}=A_{0}
$$

* The partial wave amplitudes are described in terms of transversity amplitudes as

$$
S=\frac{1}{\sqrt{3}}\left(\sqrt{2} A_{\|}-A_{0}\right), \quad P=A_{\perp}, \quad D=\frac{1}{\sqrt{3}}\left(A_{\|}+\sqrt{2} A_{0}\right)
$$

Transversity basis is convenient for separation of CP-even and $C P$-odd components of the amplitude.

The partial wave amplitudes $S, P, D$ and the helicty amplitudes $H_{0}, H_{+}, H_{-}$are not very useful for our purpose.

Note $A_{0} \equiv A_{L}$

Hence, the partial decay rate for $B \rightarrow D^{*} \rho \rightarrow(D \pi)(\pi \pi)$ can be written as

$$
\begin{aligned}
& \frac{d \Gamma}{d \cos \theta_{1} d \cos \theta_{2} d \phi} \\
& \propto\left(\left|A_{L}\right|^{2} \cos ^{2} \theta_{1} \cos ^{2} \theta_{2}+\frac{\left|A_{\perp}\right|^{2}}{2} \sin ^{2} \theta_{1} \sin ^{2} \theta_{2} \sin ^{2} \phi+\frac{\left|A_{\|}\right|^{2}}{2} \sin ^{2} \theta_{1} \sin ^{2} \theta_{2} \cos ^{2} \phi\right. \\
& \left.+\frac{\operatorname{Re}\left(A_{L} A_{\|}^{*}\right)}{2 \sqrt{2}} \sin 2 \theta_{1} \sin 2 \theta_{2} \cos \phi-\frac{\operatorname{Im}\left(A_{\perp} A_{L}^{*}\right)}{2 \sqrt{2}} \sin 2 \theta_{1} \sin 2 \theta_{2} \sin \phi-\frac{\operatorname{Im}\left(A_{\perp} A_{\|}^{*}\right)}{2} \sin ^{2} \theta_{1} \sin ^{2} \theta_{2} \sin 2 \phi\right)
\end{aligned}
$$

Blue terms are Pand Teven
Red terms are P and T odd
However if one considers the decay $B \rightarrow K^{*} J / \psi \rightarrow(K \pi)(l l)$ the rate is given by

$$
\begin{aligned}
\propto & \left(\left|A_{L}\right|^{2} \cos ^{2} \theta_{1} \sin ^{2} \theta_{2}+\frac{\left|A_{\perp}\right|^{2}}{2} \sin ^{2} \theta_{1}\left(\cos ^{2} \theta_{2} \sin ^{2} \phi+\cos ^{2} \phi\right)+\frac{\left|A_{\|}\right|^{2}}{2} \sin ^{2} \theta_{1}\left(\cos ^{2} \theta_{2} \cos ^{2} \phi+\sin ^{2} \phi\right)\right. \\
& \left.+\frac{\operatorname{Re}\left(A_{L} A_{\|}^{*}\right)}{2 \sqrt{2}} \sin 2 \theta_{1} \sin 2 \theta_{2} \cos \phi-\frac{\operatorname{Im}\left(A_{\perp} A_{L}^{*}\right)}{2 \sqrt{2}} \sin 2 \theta_{1} \sin 2 \theta_{2} \sin \phi-\frac{\operatorname{Im}\left(A_{\perp} A_{\|}^{*}\right)}{2} \sin ^{2} \theta_{1} \sin ^{2} \theta_{2} \sin 2 \phi\right)
\end{aligned}
$$

Expressions depend on decay mode!

Confusion??? !!! e.g. consider $B \rightarrow K^{*} J / \psi \rightarrow K \pi l^{+} l^{-}$ A common choice is to assume that $\mathrm{J} / \psi$ at rest and not the $B$

Transversity frame popular among experimentalists

Helicity frame B at rest

Transversity frame $J / \psi$ at rest
See BaBar Physics Book

$$
\cos \theta_{2}=\sin \theta_{t r} \cos \theta_{t r}
$$

$\sin \theta_{2} \sin \phi=\cos \theta_{t r}$
$\sin \theta_{2} \cos \phi=\sin \theta_{t r} \sin \phi_{t r}$

In the transversity frame the partial decay rate in terms of transversity amplitudes is written as

$$
\begin{aligned}
& \frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{1} d \cos \theta_{t r} d \phi_{t r}} \\
& =\frac{9}{32} \frac{1}{\sqrt{2}}\left(\left|A_{L}\right|^{2} 2 \cos ^{2} \theta_{1}\left(1-\sin ^{2} \theta_{t r} \cos ^{2} \phi_{t r}\right)+\left|A_{\|}\right|^{2} \cos ^{2} \theta_{1}\left(1-\sin ^{2} \theta_{t r} \sin ^{2} \phi_{t r}\right)\right. \\
& +\left|A_{\perp}\right|^{2} \sin ^{2} \theta_{1} \sin ^{2} \theta_{t r}-\frac{\operatorname{Re}\left(A_{L} A_{\|}^{*}\right)}{\sqrt{2}} \sin 2 \theta_{1} \sin ^{2} \theta_{t r} \sin 2 \phi_{t r}+\frac{\operatorname{Im}\left(A_{\perp} A_{L}^{*}\right)}{\sqrt{2}} \sin 2 \theta_{1} \sin 2 \theta_{t r} \cos 2 \phi_{t r} \\
& \left.+\frac{\operatorname{Im}\left(A_{\perp} A_{\|}^{*}\right)}{2} \sin ^{2} \theta_{1} \sin 2 \theta_{t r} \sin \phi_{t r}\right)
\end{aligned}
$$

We define the longitudinal polarization ratios as

$$
F_{L}=\frac{\Gamma_{L}}{\Gamma}=\frac{\left|A_{L}\right|^{2}}{\left|A_{L}\right|^{2}+\left|A_{\|}\right|^{2}+\left|A_{\perp}\right|^{2}}
$$

$F_{L}$ easilyobtained by a one parameter fit to the $\theta_{1}, \theta_{2}$ distribution
$\frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{1} d \cos \theta_{2}}=\frac{9}{32}\left(1-F_{L}\right) \sin ^{2} \theta_{1}\left(1+\cos ^{2} \theta_{2}\right)+\frac{9}{8} F_{L} \cos ^{2} \theta_{1} \sin ^{2} \theta_{2}$
$F_{\perp}$ is similarly defined as $F_{\perp}=\frac{\Gamma_{\perp}}{\Gamma}=\frac{\left|A_{\perp}\right|^{2}}{\left|A_{L}\right|^{2}+\left|A_{\|}\right|^{2}+\left|A_{\perp}\right|^{2}}$
$F_{\perp}$ is easily obtained by a one parameter fit in transversity basis

$$
\frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{t r}}=\frac{3}{8}\left(1-F_{\perp}\right)\left(1+\cos ^{2} \theta_{t r}\right)+\frac{3}{4} F_{\perp} \sin ^{2} \theta_{t r}
$$

The above relations are for $B \rightarrow K^{*} J / \psi$. For $B \rightarrow D^{*} \rho$ the analogous relations are

$$
\begin{gathered}
\frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{1} d \cos \theta_{2}}=\frac{9}{16}\left(1-F_{L}\right) \sin ^{2} \theta_{1} \sin ^{2} \theta_{2}+\frac{9}{4} F_{L} \cos ^{2} \theta_{1} \cos ^{2} \theta_{2} \\
\frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{t r}}=\frac{3}{4}\left(1-F_{\perp}\right) \sin ^{2} \theta_{t r}+\frac{3}{2} F_{\perp} \cos ^{2} \theta_{t r}
\end{gathered}
$$

Important: The choice of frame may help in simplifying the problem we are interested in.
One is however interested in all the information that angular analysis can provide and not just in one component.
The best choice is to use the transversity basis in the Helicity frame, especially to study interesting CP violating signals that do not need flavour or time tagging.

We learnt that the differential decay rate for $B \rightarrow V V$ decays may be written as
$\frac{1}{\Gamma} \frac{d \Gamma}{d \cos \theta_{1} d \cos \theta_{2} d \phi}$
$=\frac{9}{16 \pi}\left(\left|F_{L}\right|^{2} f_{L L}+\left|F_{\perp}\right|^{2} f_{\perp \perp}+\left|F_{\|}\right|^{2} f_{\| \|}+\operatorname{Re}\left(F_{L} F_{\|}^{*}\right) f_{L \|}-\operatorname{Im}\left(F_{\perp} F_{L}^{*}\right) f_{\perp L}\right.$
$\left.-\operatorname{Im}\left(F_{\perp} F_{\|}^{*}\right) f_{\perp \|}\right)$
where $\left|F_{L}\right|^{2}+\left|F_{\|}\right|^{2}+\left|F_{\perp}\right|^{2}=1$ and $f_{\lambda \sigma}$ are the coefficients of the helicity amplitudes that depend purely on the angles describing the kinematics.
Consider the decay corresponding to the conjugate process; its amplitude may be written using CPT invariance as

$$
A\left(B(p) \rightarrow V_{1}\left(k, \epsilon_{1}\right) V_{2}\left(q, \epsilon_{2}\right)=\epsilon_{1}^{\mu} \epsilon_{2}^{v}\left(a g_{\mu \nu}+\frac{b}{m_{1} m_{2}} p_{\mu} p_{v}+i \frac{c}{m_{1} m_{2}} \epsilon_{\mu v \alpha \beta} k^{\alpha} q^{\beta}\right)\right.
$$

Note the switch of sign of the $P$-wave term in the conjugate process when compared with the amplitude for the process.

$$
A\left(\bar{B}(p) \rightarrow \bar{V}_{1}\left(k, \epsilon_{1}\right) \bar{V}_{2}\left(q, \epsilon_{2}\right)=\epsilon_{1}^{\mu} \epsilon_{2}^{v}\left(\bar{a} g_{\mu \nu}+\frac{\bar{b}}{m_{1} m_{2}} p_{\mu} p_{v}-i \frac{\bar{c}}{m_{1} m_{2}} \epsilon_{\mu \nu \alpha \beta} k^{\alpha} q^{\beta}\right)\right.
$$

## Why $B \rightarrow K^{*} \ell^{+} \ell^{-}$?

1. Penguin process. Rare FCNC decay. Good place to look for NP.
2. One has a large number of related observables each measured as a function of the dilepton invariant mass. This mode that get contribution from variety of operators i.e. various new particles in the loop. It is therefore more likely that NP contributes to this mode than say $B_{s} \rightarrow \mu^{+} \boldsymbol{\mu}^{-}$.
3. Clean mode. Can be studied in a manner where there is almost none or reduced hadronic uncertainty.
4. Several asymmetries in addition to $A_{F B}$ can be measured which are sensitive to NP via interference as linear effects.

## Semileptonic FCNC process... a cleaner route

## Effective Hamiltomian for $b \rightarrow s \ell \ell$

The decay $B(p) \rightarrow K^{*}(k) \ell^{-}\left(q_{1}\right) \ell^{+}\left(q_{2}\right)$ at the quark level can be described by effective weak Hamiltonian $\mathcal{H}_{\text {eff }}$ for $\boldsymbol{b} \rightarrow \boldsymbol{s} \ell^{+} \ell^{-}$as

$$
\begin{aligned}
& \mathcal{H}_{e f f}=\frac{G_{F} \alpha}{\sqrt{2}} V_{t b} V_{t s}^{*}\left[C_{9}^{e f f}\left(\bar{s} \gamma^{\mu} P_{L} b\right) \bar{l} \gamma^{\mu} l+C_{10}\left(\bar{s} \gamma^{\mu} P_{L} b\right) \bar{l} \gamma^{\mu} \gamma^{5} l \quad\right. \text { dominant } \\
& \left.\left.\boldsymbol{q}=\boldsymbol{q}_{\mathbf{1}}+\boldsymbol{q}_{\mathbf{2}} \boldsymbol{P}_{\mathbf{L}, \boldsymbol{R}} \quad-\frac{2 C_{7}^{\text {eff }}}{q^{2}}\left(\overline{\operatorname{s}} i \sigma_{\mathrm{K}}\right) \quad q^{\nu} m_{b} P_{R} b\right) \bar{l} \gamma^{\mu} l\right] \\
& =\frac{\left(1 \mp \gamma_{5}\right)}{2} \\
& C_{7}^{\text {eff }}=-0.304 \\
& C_{9}^{\mathrm{eff}}=4.211+Y\left(q^{2}\right) \\
& C_{10}=-4.103 \\
& =C_{7}-\frac{1}{3} C_{3}-\frac{4}{9} C_{4}-\frac{20}{3} C_{5}-\frac{80}{9} C_{6} \quad \alpha_{S}\left(m_{W}\right)=0.120, \alpha_{S}\left(m_{b}\right)=0.214, m_{t}\left(m_{t}\right)= \\
& 162.3 \mathrm{GeV}, m_{W}=80.4 \mathrm{GeV} \text { and } \sin ^{2} 2 \theta_{W}=0.23 \text {. } \\
& Y\left(q^{2}\right)=\frac{4}{3} C_{3}+\frac{64}{9} C_{5}+\frac{64}{27} C_{6}+h\left(q^{2}, m_{c}\right)\left(\frac{4}{3} C_{1}+C_{2}+6 C_{3}+60 C_{5}\right) \\
& -\frac{1}{2} h\left(q^{2}, m_{b}\right)\left(7 C_{3}+\frac{4}{3} C_{4}+76 C_{5}+\frac{64}{3} C_{6}\right)-\frac{1}{2} h\left(q^{2}, 0\right)\left(C_{3}+\frac{4}{3} C_{4}+16 C_{5}+\frac{64}{3} C_{6}\right) \\
& h\left(q^{2}, m_{q}\right)=-\frac{4}{9}\left(\ln \frac{m_{q}^{2}}{\mu^{2}}-\frac{2}{3}-y\right)-\frac{4}{9}(2+y) \sqrt{|y-1|} \times\left\{\begin{array}{ccc}
\tan ^{-1} \frac{1}{\sqrt{y-1}} & y>1 & y=\frac{4 m_{q}^{2}}{q^{2}} \\
\ln \frac{1+\sqrt{1-y}}{\sqrt{y}}-i \frac{\pi}{2} & y \leq 1 & 27
\end{array}\right\}
\end{aligned}
$$

## Matrix element for $B \rightarrow \mathbb{K}^{*} \ell^{+} \ell^{-}$

The matrix element for the decay mode $B(p) \rightarrow K^{*}(k) \ell^{-}\left(q_{1}\right) \ell^{+}\left(q_{2}\right)$

$$
\begin{aligned}
\mathcal{M}=\frac{G_{F} \alpha}{\sqrt{2} \pi} V_{t b} V_{t s}^{*}\{ & C_{9}\left\langle K^{*}\right| \bar{s} \gamma^{\mu} P_{L} b|\bar{B}\rangle \bar{\ell} \gamma_{\mu} \ell+C_{10}\left\langle K^{*}\right| \bar{s} \gamma^{\mu} P_{L} b|\bar{B}\rangle \bar{\ell} \gamma_{\mu} \gamma_{5} \ell \\
& -\frac{2 m_{b}}{q^{2}} C_{7} \underbrace{\left\langle K^{*}\right| \bar{s} i \sigma^{\mu v} q_{v} P_{R} b|\bar{B}\rangle} \bar{\ell} \gamma_{\mu} \ell\}
\end{aligned}
$$

Hadronic matrix element
challenge to reliably calculate. Estimated in various theories: LCSR, Lattice QCD, HQET, LEET ... tremendous effort in literature
Unfortunately simple picture of decay presented above is not accurate enough non-local contribution

[^0]A. Khodjamirian, T. Mannel, A. A. Pivovarov and Y.-M. Wang, JHEP 1009, 089 (2010);A. Khodjamirian arXiv:1312.6480

## Non-local contributions

Since the matrix element of the semi-leptonic operator $\mathcal{O}_{9,10}$ can be expressed through $B \rightarrow K^{*}$ form factors, the non-factorizable corrections contribute to the decay amplitude only through the production of a virtual photon, which then decays into lepton pair.
Exist additional non-factorizable and long-distance contributions Electromagnetic corrections of purely hadronic operators
$\Rightarrow$ Complete Hamiltonian

$$
A\left(B(p) \rightarrow K^{*}(k) \ell^{+} \ell^{-}\right)
$$

$$
=\frac{G_{F} \alpha}{\sqrt{2} \pi} V_{t b} V_{t s}^{*}\left[\left\{C_{9}\left\langle K^{*}\right| \bar{s} \gamma^{\mu} P_{L} b|\bar{B}\rangle-\frac{2 C_{7}}{q^{2}}\left\langle K^{*}\right| \bar{s} i \sigma^{\mu v} q_{v}\left(m_{b} P_{R}+m_{s} P_{L}\right) b|\bar{B}\rangle\right.\right.
$$

$$
\left.\left.-\frac{16 \pi^{2}}{q^{2}} \sum_{i=\{1-6,8\}} C_{i} \mathcal{H}_{i}^{\mu}\right\} \bar{\ell} \gamma_{\mu} \ell+C_{10}\left\langle K^{*}\right| \bar{s} \gamma^{\mu} P_{L} b|\bar{B}\rangle \bar{\ell} \gamma_{\mu} \gamma_{5} \ell\right]
$$

nonlocal hadronic matrix elements

## Hadronic matrix elements

Lorentz invariance to write the most general form of the Matrix element

$$
\begin{aligned}
& \left\langle K^{*}\left(\epsilon^{*}, k\right)\right| \bar{s} \gamma^{\mu} P_{L} b|B(p)\rangle \\
& \quad=\epsilon_{v}^{*}\left(x_{0} q^{\mu} q^{\nu}+x_{1}\left(g^{\mu \nu}-\frac{q^{\mu} q^{v}}{q^{2}}\right)+X_{2}\left(k^{\mu}-\frac{k \cdot q}{q^{2} q^{\mu}}\right) q^{v}+i X_{3} \epsilon^{\mu v \rho \sigma} k_{\rho} q_{\sigma}\right)
\end{aligned}
$$

Vector current conserved and only the $\chi_{0}$ term in divergence of axial part survives. $q^{\mu}$ term vanishes in the limit of massless leptons.

$$
\begin{aligned}
& \left\langle K^{*}\left(\epsilon^{*}, k\right)\right| i \bar{s} \sigma^{\mu v} q_{\nu} P_{R, L} b|B(p)\rangle \\
& \quad=\epsilon_{\nu}^{*}\left( \pm \mathcal{Y}_{1}\left(g^{\mu \nu}-\frac{q^{\mu} q^{v}}{q^{2}}\right) \pm \mathcal{Y}_{2}\left(k^{\mu}-\frac{k \cdot q}{q^{2}} q^{\mu}\right) q^{v}+i \mathcal{Y}_{3} \epsilon^{\mu v \rho \sigma} k_{\rho} q_{\sigma}\right)
\end{aligned}
$$

Ensure that $\boldsymbol{q}_{\mu}\left\langle\boldsymbol{K}^{*}\left(\boldsymbol{\epsilon}^{*}, \boldsymbol{k}\right)\right| \boldsymbol{i} \bar{s} \sigma^{\mu v} \boldsymbol{q}_{\nu} \boldsymbol{P}_{R, L} \boldsymbol{b}|\boldsymbol{B}(\boldsymbol{p})\rangle=\mathbf{0}$
Nonlocal hadronic matrix elements

$$
\begin{aligned}
\mathcal{H}_{i}^{\mu} & =\left\langle K^{*}\left(\epsilon^{*}, k\right)\right| i \int d^{4} x e^{i q \cdot x} T\left\{j_{e m}^{\mu}(x), \mathcal{O}_{i}(0)\right\}|B(p)\rangle \\
& =\epsilon_{v}^{*}\left(Z_{1}^{i}\left(g^{\mu \nu}-\frac{q^{\mu} q^{\nu}}{q^{2}}\right)+Z_{2}^{i}\left(k^{\mu}-\frac{k \cdot q}{q^{2}} q^{\mu}\right) q^{\nu}+i Z_{3}^{i} \epsilon^{\mu \nu \rho \sigma} k_{\rho} q_{\sigma}\right)
\end{aligned}
$$

Ignore nonlocal contributions for the moment. Get back to them later...

## In terms of $q^{\mathbf{2}}$ dependent well known from factors $V, A_{1,2}, T_{1,2,3}$

$\left\langle K^{*}\left(\epsilon^{*}, k\right)\right| \overline{\bar{\gamma}}{ }^{\mu} P_{L} b|B(p)\rangle$

$$
=-i \epsilon_{\mu}^{*}\left(m_{B}+m_{K^{*}}\right) A_{1}\left(q^{2}\right)+p_{\mu}\left(\epsilon^{*} \cdot q\right) \frac{2 A_{2}\left(q^{2}\right)}{m_{B}+m_{K^{*}}}+i \epsilon_{\mu \nu \rho \sigma} \epsilon^{* v} p^{\rho} k^{\sigma} \frac{2 V\left(q^{2}\right)}{m_{B}+m_{K^{*}}}
$$

$\left\langle K^{*}\left(\epsilon^{*}, k\right)\right| i \bar{s} \sigma^{\mu v} q_{v} P_{R, L} b|B(p)\rangle$

$$
\begin{gathered}
=i \epsilon_{\mu v \rho \sigma} \epsilon^{* v} p^{\rho} k^{\sigma} 2 T_{1}\left(q^{2}\right) \pm T_{2}\left(q^{2}\right)\left[\epsilon_{\mu}^{*}\left(m_{B}^{2}-m_{K^{*}}^{2}\right)-2\left(\epsilon^{*} \cdot q\right) p_{\mu}\right] \\
\mp\left(\epsilon^{*} \cdot q\right) q^{2} \frac{2 T_{3}\left(q^{2}\right)}{m_{B}^{2}-m_{K^{*}}^{2}} p^{\mu}
\end{gathered}
$$

$X_{i}$ 's and $\mathcal{Y}_{i}$ 's can be related to form factors $V, A_{0,1,2}$ and $T_{1,2,3}$

$$
\begin{array}{ll}
\mathcal{X}_{1}=-\frac{1}{2}\left(m_{B}+m_{K^{*}}\right) A_{1}\left(q^{2}\right), & \mathcal{Y}_{1}=\frac{1}{2}\left(m_{B}^{2}-m_{K^{*}}^{2}\right) T_{2}\left(q^{2}\right) \\
\mathcal{X}_{2}=\frac{A_{2}\left(q^{2}\right)}{m_{B}+m_{K^{*}}}, & \mathcal{Y}_{2}=-T_{2}\left(q^{2}\right)-\frac{q^{2}}{m_{B}^{2}-m_{K^{*}}^{2}} T_{3}\left(q^{2}\right), \\
\mathcal{X}_{3}=\frac{V\left(q^{2}\right)}{m_{B}+m_{K^{*}}}, & \mathcal{Y}_{3}=-T_{1}\left(q^{2}\right) .
\end{array}
$$

What we really want is the final state where $K^{*}\left(\epsilon_{\mu}^{*}, k\right)$ has decayed to $K\left(k_{1}\right) \pi\left(k_{2}\right)$. This is achieved by replacing $\epsilon_{\mu}^{*} \rightarrow D_{K^{*}}\left(k^{2}\right) W_{\mu}$, where

$$
W_{\mu}=K_{\mu}-\xi k_{\mu}, k=k_{1}+k_{2}, K=k_{1}-k_{2} \text { and } \xi=\frac{m_{K}^{2}-m_{\pi}^{2}}{k^{2}} .
$$

$$
\left|D_{K^{*}}\left(k^{2}\right)\right|^{2}=\frac{g_{K^{*} K \pi}^{2}}{\left(k^{2}-m_{K^{*}}^{2}\right)^{2}+\left(m_{K^{*}} \Gamma_{K^{*}}\right)^{2}} \stackrel{\Gamma_{K^{*}} \ll m_{K^{*}}}{\longrightarrow} \frac{\pi g_{K^{*} K \pi}^{2}}{m_{K^{*}} \Gamma_{K^{*}}} \delta\left(k^{2}-m_{K^{*}}^{2}\right)
$$

$$
A\left(B(p) \rightarrow k\left(k_{1}\right) \pi\left(k_{2}\right) \ell^{+} \ell^{-}\right)=\frac{G_{F} \alpha}{\sqrt{2} \pi} V_{t b} V_{t s}^{*} D_{K^{*}}\left(k^{2}\right)
$$

$$
\times\left\{\left[W_{\mu} \mathcal{v}_{1}^{L}+W \cdot q k_{\mu} \mathcal{V}_{2}^{L}+i \epsilon_{\mu v \rho \sigma} K^{* v} k^{\rho} q^{\sigma} \mathcal{V}_{3}^{L}\right] \bar{\ell} \gamma^{\mu} P_{L} \ell+L \rightarrow R\right\}
$$

$$
V_{i}^{L, R}=C_{L, R} X_{i}-\frac{2 m_{b}}{q^{2}} C_{7} \mathcal{Y}_{i} \quad \begin{aligned}
& \text { Remember that in the massless lepton limit } L \\
& \text { and } R \text { terms do not interfere }
\end{aligned}
$$

$$
C_{L, R}=C_{9} \mp C_{10}
$$

A. Faessler, T. Gutsche, M. A. Ivanov, J. G. Korner and V. E. Lyubovitskij, Eur. Phys. J. C4, 18 (2002) lepton mass effect

The decay $B(p) \rightarrow \boldsymbol{K}^{*}\left(\rightarrow \boldsymbol{K}\left(\boldsymbol{k}_{1}\right) \pi\left(\boldsymbol{k}_{2}\right)\right) \ell^{+}\left(\boldsymbol{q}_{2}\right) \ell^{-}\left(\boldsymbol{q}_{1}\right)$ in the helicity frame

K
$X=\frac{1}{2} \lambda^{1 / 2}\left(m_{B}^{2}, q^{2}, m_{K^{*}}^{2}\right)$
$\beta_{K^{*}}=\frac{\lambda^{1 / 2}\left(m_{K^{*}}^{2}, m_{K}^{2}, m_{\pi}^{2}\right)}{m_{K^{*}}^{2}}$
$\boldsymbol{q} \cdot \boldsymbol{K}=\xi(\boldsymbol{k} \cdot \boldsymbol{q})+\boldsymbol{\beta}_{\boldsymbol{K}^{*}} X \cos \boldsymbol{\theta}_{\boldsymbol{K}}$
k. $K=\xi m_{K^{*}}^{2}$
k. $Q=X \cos \theta_{\ell}$
$K . Q=\xi k \cdot Q+\beta_{K^{*}}\left[k \cdot q \cos \theta_{\ell} \cos \theta_{K}-\sqrt{q^{2} m_{K^{*}}^{2}} \sin \theta_{\ell} \sin \theta_{K} \cos \phi\right]$
$\epsilon_{\mu \nu \alpha \beta} \boldsymbol{k}^{\mu} \boldsymbol{K}^{\nu} \boldsymbol{q}^{\alpha} \boldsymbol{Q}^{\beta}=-\sqrt{\boldsymbol{q}^{2} \boldsymbol{m}_{\boldsymbol{K}^{*}}^{2} \boldsymbol{\beta}_{\boldsymbol{K}^{*}} \boldsymbol{X} \sin \boldsymbol{\theta}_{\ell} \sin \boldsymbol{\theta}_{\boldsymbol{K}} \sin \boldsymbol{\phi}}$

It is easily seen that

$$
\begin{aligned}
& \frac{d^{4} \Gamma\left(B \rightarrow(K \pi) \ell^{+} \ell^{-}\right)}{d q^{2} d \cos \theta_{\ell} d \cos \theta_{K} d \phi}=I\left(q^{2}, \theta_{\ell}, \theta_{K}, \phi\right) \\
& =\frac{9}{32 \pi}\left[I_{1}^{S} \sin ^{2} \theta_{K}+I_{1}^{c} \cos ^{2} \theta_{K}+\left(I_{2}^{S} \sin ^{2} \theta_{K}+I_{2}^{c} \cos ^{2} \theta_{K}\right) \cos 2 \theta_{\ell}\right. \\
& \quad+I_{3} \sin ^{2} \theta_{K} \sin ^{2} \theta_{\ell} \cos 2 \phi+I_{4} \sin 2 \theta_{K} \sin 2 \theta_{\ell} \cos \phi+I_{5} \sin 2 \theta_{K} \sin \theta_{\ell} \cos \phi \\
& \quad+I_{6} \sin ^{2} \theta_{K} \cos \theta_{\ell}+I_{7} \sin 2 \theta_{K} \sin \theta_{\ell} \sin \phi+I_{8} \sin 2 \theta_{K} \sin 2 \theta_{\ell} \sin \phi \\
& \left.\quad+I_{9} \sin ^{2} \theta_{K} \sin ^{2} \theta_{\ell} \sin 2 \phi\right]
\end{aligned}
$$

Define transversity amplitudes $\quad \mathcal{A}_{t}=-\frac{N}{m_{K}^{*}} \sqrt{q^{2}} \lambda^{1 / 2}\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \hat{C}_{10} \mathcal{X}_{0}$, $\mathcal{A}_{\|}^{\boldsymbol{L}, \boldsymbol{R}}=\mathbf{2} \sqrt{\mathbf{2}} \boldsymbol{N} \mathcal{V}_{\mathbf{1}}^{\boldsymbol{L}, \boldsymbol{R}} \quad \quad N=V_{t b} V_{t s}^{*}\left[\frac{G_{F}^{2} \alpha^{2}}{3 \times 2^{10} \pi^{5} m_{B}^{3}} q^{2} \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)} \beta\right]^{1 / 2}$.

$$
\begin{aligned}
& \mathcal{A}_{0}^{L, R}=\frac{N}{2 m_{K^{*}} \sqrt{q^{2}}}\left[4 k \cdot q v_{1}^{L, R}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \mathcal{V}_{2}^{L, R}\right] \\
& \mathcal{A}_{\perp}^{L, R}=\sqrt{2} N \lambda^{1 / 2}\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \mathcal{V}_{3}^{L, R}
\end{aligned}
$$

## Where we have the amplitudes in terms of conventional form-factors:

$$
\begin{aligned}
& \mathcal{A}_{\perp}^{L, R}=N \sqrt{2} \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)}\left[\left[\left(C_{9}^{\mathrm{eff}} \mp C_{10}^{\mathrm{eff}}\right)\right] \frac{V\left(q^{2}\right)}{m_{B}+m_{K^{*}}}+\frac{2 m_{b}}{q^{2}} C_{7}^{\mathrm{eff}} T_{1}\left(q^{2}\right)\right], \\
& \mathcal{A}_{\|}^{L, R}=-N \sqrt{2}\left(m_{B}^{2}-m_{K^{*}}^{2}\right)\left[\left[\left(C_{9}^{\mathrm{eff}} \mp C_{10}^{\mathrm{eff}}\right)\right] \frac{A_{1}\left(q^{2}\right)}{m_{B}-m_{K^{*}}}+\frac{2 m_{b}}{q^{2}} C_{7}^{\mathrm{eff}} T_{2}\left(q^{2}\right)\right], \\
& \mathcal{A}_{0}^{L, R}=-\frac{N}{2 m_{K^{\cdot}} \sqrt{q^{2}}}\left(\left[\left(C_{9}^{\mathrm{eff}} \mp C_{10}^{\mathrm{eff}}\right)\right] \times\left[\left(m_{B}^{2}-m_{K^{*}}^{2}-q^{2}\right)\left(m_{B}+m_{K^{*}}\right) A_{1}\left(q^{2}\right)-\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \frac{A_{2}\left(q^{2}\right)}{m_{B}+m_{K^{*}}}\right]\right. \\
& \left.+2 m_{b} C_{7}^{\text {eff }}\left[\left(m_{B}^{2}+3 m_{K^{*}}^{2}-q^{2}\right) T_{2}\left(q^{2}\right)-\frac{\lambda\left(m_{B}^{2}, m_{K^{\bullet}}^{2}, q^{2}\right)}{m_{B}^{2}-m^{2}} T_{3}\left(q^{2}\right)\right]\right) \quad \text { implicit dependence } \\
& \text { on } q^{2} \\
& I_{1}^{s}=\frac{\left(2+\beta^{2}\right)}{4}\left[\left|\mathcal{A}_{\perp}^{L}\right|^{2}+\left|\mathcal{A}_{\|}^{L}\right|^{2}+(L \rightarrow R)\right] \\
& +\frac{4 m^{2}}{q^{2}} \operatorname{Re}\left(\mathcal{A}_{\perp}^{L} \mathcal{A}_{\perp}^{R *}+\mathcal{A}_{\|}^{L} \mathcal{A}_{\|}^{R *}\right), \\
& I_{4}=\frac{\beta^{2}}{\sqrt{2}}\left[\operatorname{Re}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\|}^{L *}\right)+(L \rightarrow R)\right], \\
& \Rightarrow I_{5}=\sqrt{2} \beta\left[\operatorname{Re}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\perp}^{L *}\right)-(L \rightarrow R)\right], \\
& I_{1}^{c}=\left|\mathcal{A}_{0}^{L}\right|^{2}+\left|\mathcal{A}_{0}^{R}\right|^{2}+\frac{4 m^{2}}{q^{2}}\left[\left|\mathcal{A}_{t}\right|^{2}+2 \operatorname{Re}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{0}^{R *}\right)\right], \quad \Rightarrow I_{6}^{s}=2 \beta\left[\operatorname{Re}\left(\mathcal{A}_{\|}^{L} \mathcal{A}_{\perp}^{L *}\right)-(L \rightarrow R)\right], \\
& I_{2}^{s}=\frac{\beta^{2}}{4}\left[\left|\mathcal{A}_{\perp}^{L}\right|^{2}+\left|\mathcal{A}_{\|}^{L}\right|^{2}+(L \rightarrow R)\right], \\
& I_{7}=\sqrt{2} \beta\left[\operatorname{Im}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\|}^{L *}\right)-(L \rightarrow R)\right], \\
& I_{2}^{c}=-\beta^{2}\left[\left|\mathcal{A}_{0}^{L}\right|^{2}+(L \rightarrow R)\right], \quad \boldsymbol{\beta}=\sqrt{1-\frac{4 \boldsymbol{m}^{2}}{\boldsymbol{q}^{2}}} \Rightarrow I_{8}=\frac{1}{\sqrt{2}} \beta^{2}\left[\operatorname{Im}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\perp}^{L *}\right)+(L \rightarrow R)\right], \\
& I_{3}=\frac{\beta^{2}}{2}\left[\left|\mathcal{A}_{\perp}^{L}\right|^{2}-\left|\mathcal{A}_{\|}^{L}\right|^{2}+(L \rightarrow R)\right], \\
& \Rightarrow I_{9}=\beta^{2}\left[\operatorname{Im}\left(\mathcal{A}_{\|}^{L *} \mathcal{A}_{\perp}^{L}\right)+(L \rightarrow R)\right],
\end{aligned}
$$

In SM for this mode CP violation is very small. Ignoring the small CP violation we have for the conjugate mode $\bar{B} \rightarrow(\bar{K} \bar{\pi}) \ell^{+} \ell^{-}$
$\frac{d^{4} \Gamma\left(\bar{B} \rightarrow(\bar{K} \bar{\pi}) \ell^{+} \ell^{-}\right)}{d q^{2} d \cos \theta_{\ell} d \cos \theta_{K} d \phi}=\bar{I}\left(q^{2}, \theta_{\ell}, \theta_{K}, \phi\right)$

$$
\begin{aligned}
= & \frac{9}{32 \pi}\left[I_{1}^{s} \sin ^{2} \theta_{K}+I_{1}^{c} \cos ^{2} \theta_{K}+\left(I_{2}^{s} \sin ^{2} \theta_{K}+I_{2}^{c} \cos ^{2} \theta_{K}\right) \cos 2 \theta_{\ell}\right. \\
& +I_{3} \sin ^{2} \theta_{K} \sin ^{2} \theta_{\ell} \cos 2 \phi+I_{4} \sin 2 \theta_{K} \sin 2 \theta_{\ell} \cos \phi-I_{5} \sin 2 \theta_{K} \sin \theta_{\ell} \cos \phi \\
& -I_{6} \sin ^{2} \theta_{K} \cos \theta_{\ell}+I_{7} \sin 2 \theta_{K} \sin \theta_{\ell} \sin \phi-I_{8} \sin 2 \theta_{K} \sin 2 \theta_{\ell} \sin \phi \\
& \left.-I_{9} \sin ^{2} \theta_{K} \sin ^{2} \theta_{\ell} \sin 2 \phi\right]
\end{aligned}
$$

Note that the terms linearly proportional to $\mathcal{A}_{\perp}$ have switched sign when going from mode to conjugate mode. If $K \equiv K_{s}$ and $\pi \equiv \pi^{0}$ adding partial decay rates for $B^{0}$ and $\overline{B^{0}}$ will result in vanishing contribution from $I_{5,6,8,9}$. These rates have $t$ be subtracted to obtain a CP conserving partial rate

## Observables in $\boldsymbol{B} \rightarrow \boldsymbol{K}^{*} \ell^{+} \ell^{-}$

$$
\begin{aligned}
& F_{L}=\frac{\left|\mathcal{A}_{0}^{L}\right|^{2}+\left|\mathcal{A}_{0}^{R}\right|^{2}}{\Gamma_{f}} \quad \frac{d \Gamma}{d q^{2}}=\sum_{\lambda=0, \|, \perp}\left(\left|\mathcal{A}_{\lambda}^{L}\right|^{2}+\left|\mathcal{A}_{\lambda}^{R}\right|^{2}\right) \quad \lambda \text { is } K^{*} \text { polarization } \\
& \left|\mathcal{A}_{1}^{L}\right|^{2}+\left|\mathcal{A}_{\|}^{R}\right|^{2} \quad \quad \quad \text { L, } \boldsymbol{R} \text { chirality of } \ell^{-} \\
& F_{\|}=\frac{\left|\mathcal{A}_{\| \mid}^{L}\right|+\left|\mathcal{A}_{\| \mid}^{R}\right|}{\Gamma_{f}} \quad F_{L}+F_{\|}+F_{\perp}=1 \quad 3 \text { observables } \boldsymbol{F}_{L}, F_{\perp}, \mathbb{X}_{\mathrm{K}} \\
& F_{\perp}=\frac{\left|\mathcal{A}_{\perp}^{L}\right|^{2}+\left|\mathcal{A}_{\perp}^{R}\right|^{2}}{\Gamma_{f}} \\
& A_{4}=\frac{1}{\Gamma_{f}} \int_{D_{L R}} d \phi \int_{D} d \cos \theta_{K} \int_{D} d \cos \theta_{\ell} \frac{d^{4}(\Gamma+\bar{\Gamma})}{d q^{2} d^{3} \Omega} \\
& \begin{array}{l}
\int_{D} \equiv \int_{0}^{1}-\int_{-1}^{0} \\
\int_{D_{L R}} \equiv \int_{-\pi / 2}^{\pi / 2}-\int_{\pi / 2}^{3 \pi / 2}
\end{array} \\
& A_{5}=\frac{1}{\Gamma_{f}} \int_{-1}^{1} d \cos \theta_{\ell} \int_{D_{L R}} d \phi \int_{D} d \cos \theta_{K} \frac{d^{4}(\Gamma-\bar{\Gamma})}{d q^{2} d^{3} \Omega} \\
& A_{F B}=\frac{1}{\Gamma_{f}} \int_{-1}^{1} d \cos \theta_{K} \int_{0}^{2 \pi} d \phi \int_{D} d \cos \theta_{\ell} \frac{d^{4}(\Gamma-\bar{\Gamma})}{d q^{2} d^{3} \Omega} \\
& 3 \text { asymmetry observables } \\
& \propto \boldsymbol{\operatorname { R e }}\left(\boldsymbol{A}_{\boldsymbol{\lambda}} \boldsymbol{A}_{\boldsymbol{\sigma}}^{*}\right)
\end{aligned}
$$

$A_{7}, A_{8}, A_{9}$ are 3 more asymmetry observables $\propto \operatorname{Im}\left(A_{\lambda} A_{\sigma}^{*}\right)$
/Require imaginary amplitudes
For the massless lepton case
Total 9 CP conserving observables

## Relations between observables and Amplitudes

$$
\begin{aligned}
& A_{\mathrm{FB}}=\frac{3}{2} \frac{\operatorname{Re}\left(\mathcal{A}_{\|}^{L} \mathcal{A}_{\perp}^{L^{*}}-\mathcal{A}_{\|}^{R} \mathcal{A}_{\perp}^{R^{*}}\right)}{\Gamma_{f}}, \\
& A_{4}=\frac{\sqrt{2}}{\pi} \frac{\operatorname{Re}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\|}^{L^{*}}+\mathcal{A}_{0}^{R} \mathcal{A}_{\|}^{R^{*}}\right)}{\Gamma_{f}}, \\
& A_{5}=\frac{3}{2 \sqrt{2}} \frac{\operatorname{Re}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\perp}^{L^{*}}-\mathcal{A}_{0}^{R} \mathcal{A}_{\perp}^{R^{*}}\right)}{\Gamma_{f}} \mathbb{X} \\
& A_{7}=\frac{3}{2 \sqrt{2}} \frac{\operatorname{Im}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\|}^{L *}-\mathcal{A}_{0}^{R} \mathcal{A}_{\|}^{R *}\right)}{\Gamma_{f}} \\
& A_{8}=\frac{\sqrt{2}}{\pi} \frac{\operatorname{Im}\left(\mathcal{A}_{0}^{L} \mathcal{A}_{\perp}^{L *}+\mathcal{A}_{0}^{R} \mathcal{A}_{\perp}^{R *}\right)}{\Gamma_{f}}, \\
& A_{9}=\frac{3}{2 \pi} \frac{\operatorname{Im}\left(\mathcal{A}_{\|}^{L *} \mathcal{A}_{\perp}^{L}+\mathcal{A}_{\|}^{R *} \mathcal{A}_{\perp}^{R}\right)}{\Gamma_{f}} . \\
& \text { The observables } A_{4}, A_{5}, A_{F B}, A_{7} \text {, } \\

& \text { averaged observables } S_{4}, S_{5} \text {, } \\
& A_{F B}^{\mathrm{LHCb}}, S_{7}, S_{8} \text { and } S_{9} \text { measured } \\
& \text { by LHCb } \\
& A_{4}=-\frac{2}{\pi} S_{4}, A_{5}=\frac{3}{4} S_{5}, \\
& A_{F B}=-A_{F B}^{\mathrm{LHCb}}, A_{7}=\frac{3}{4} S_{7}, \\
& A_{8}=-\frac{2}{\pi} S_{8}, A_{9}=\frac{3}{2 \pi} S_{9}, \\
& \chi_{\text {Observables absent in } B \rightarrow \psi K^{*} \text { mode. }} \\
& \text { However, they will appear if lepton } \\
& \text { helicity measured }
\end{aligned}
$$

## Effects of non-factorizable contributions

It is easy to see that the effect of non-local contributions can be straight forwardly incorporated into $C_{9}^{\text {eff }}$. We simply make the replacement $\quad c_{9} x_{j} \rightarrow c_{9}^{j} x_{j}$

$$
\begin{gathered}
-\frac{16 \pi^{2}}{q^{2}} \sum_{i=\{1-6,8\}} C_{i} \frac{z_{j}^{i}}{x_{j}}=\Delta \mathrm{C}_{9}^{(\mathrm{fac})}\left(q^{2}\right)+\Delta \mathrm{C}_{9}^{j,(\mathrm{non}-\mathrm{fac})}\left(q^{2}\right) \quad j=1,2,3 \\
C_{9} \rightarrow C_{9}^{j}=C_{9}+\Delta \mathrm{C}_{9}^{(\mathrm{fac})}\left(q^{2}\right)+\Delta \mathrm{C}_{9}^{j,(\mathrm{non}-\mathrm{fac})}\left(q^{2}\right) \\
\frac{2\left(m_{b}+m_{s}\right)}{q^{2}} C_{7} \mathcal{Y}_{j} \rightarrow \tilde{Y}_{j}=\frac{2\left(m_{b}+m_{s}\right)}{q^{2}} C_{7} \mathcal{Y}_{j}+\cdots
\end{gathered}
$$

factorizable \& non factorizable contributions
Not to be confused with $C_{9, \perp}, C_{9, \|}$ defined in Beneke, Feldmann and Seidel
Rusa Mandal, R.S. and Diganta Das Phys. Rev. $D 90096006$ (2014)
Diganta Das and R.S. Phys. Rev. D 86, 056006(2012)

Effective helicity index due to non-factorizable corrections in $C_{9}$ :

$$
\begin{gathered}
C_{9}^{\perp} \equiv C_{9}^{(3)}, C_{9}^{\|} \equiv C_{9}^{(1)}, C_{9}^{0} \equiv C_{9}^{(2)} \kappa \\
\kappa=1+\frac{C_{9}^{(1)}-C_{9}^{(2)}}{C_{9}^{(2)}} \frac{4 k \cdot q X_{1}}{4 k \cdot q X_{1}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) X_{2}}
\end{gathered}
$$

The seven amplitudes can be written in terms of the form-factors $x_{0,1,2,3}$ and $y_{1,2,3}$

$$
\begin{aligned}
& \mathcal{A}_{\perp}^{L, R}=\sqrt{2} N \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)}\left[\left(C_{9}^{\perp} \mp C_{10}\right) x_{3}-\widetilde{\mathscr{Y}}_{3}\right] \\
& \mathcal{A}_{\|}^{\mathrm{L}, R}=2 \sqrt{2} N\left[\left(C_{9}^{\|} \mp C_{10}\right) x_{1}-\zeta_{0} \widetilde{\mathscr{Y}}_{1}\right] \\
& \mathcal{A}_{0}^{\mathrm{L}, R}=\frac{N}{2 m_{K^{*}} \sqrt{q^{2}}}\left[\begin{array}{c}
\left(C_{9}^{0} \kappa \mp C_{10}\right)\left(4 k \cdot q x_{1}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) x_{2}\right) \\
-\zeta_{0}\left(4 k \cdot q \widetilde{\mathcal{Y}}_{1}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \widetilde{\mathcal{Y}}_{2}\right)
\end{array}\right] \\
& \mathcal{A}_{t}=-\frac{N}{m_{K^{*}}} \sqrt{q^{2}} \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)} C_{10} x_{0} \quad \zeta_{0}=\frac{m_{b}-m_{s}}{m_{b}+m_{s}}
\end{aligned}
$$

Note the amplitude $\mathcal{A}_{0, \|, \perp}^{L, R}$ have the form:

$$
\mathcal{A}_{\lambda}^{L, R}=C_{L, R}^{\lambda} \mathcal{F}_{\lambda}-\widetilde{\boldsymbol{G}}_{\lambda}=\left(\boldsymbol{C}_{9}^{\lambda} \mp \boldsymbol{C}_{\mathbf{1 0}}\right) \mathcal{F}_{\lambda}-\widetilde{\boldsymbol{G}}_{\lambda}
$$

Where, $\mathcal{F}_{\lambda}, \widetilde{\mathcal{G}}_{\lambda}$ new form factors that can be related to conventional form factors at a given order

$$
\begin{aligned}
& \mathcal{F}_{\perp}=\sqrt{2} N \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) X_{3} \quad \mathcal{F}_{\|}=2 \sqrt{2} N X_{1}} \\
& \mathcal{F}_{0}=\frac{N}{2 m_{K^{*}} \sqrt{q^{2}}}\left(4 k \cdot q x_{1}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) x_{2}\right) \\
& \tilde{G}_{0}=\sqrt{2} N \sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)} \frac{2\left(m_{b}-m_{s}\right)}{q^{2}} \hat{C}_{7} \mathcal{Y}_{3}+\cdots \\
& \tilde{G}_{\|}=2 \sqrt{2} N \frac{2\left(m_{b}-m_{s}\right)}{q^{2}} \hat{C}_{7} y_{1}+\cdots \\
& \tilde{G}_{0}=\frac{N}{2 m_{K^{*}} \sqrt{q^{2}}} \frac{2\left(m_{b}-m_{s}\right)}{q^{2}} \hat{C}_{7}\left(4 k \cdot q \mathcal{Y}_{1}+\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right) \mathcal{Y}_{2}\right)+\cdots
\end{aligned}
$$

## We have the amplitudes (massless limit):

Simple to define amplitudes in terms of some new form factors as

$$
\left.\mathcal{A}_{\lambda}^{L, R}=C_{L, R}^{\lambda} \mathcal{F}_{\lambda}-\widetilde{\mathcal{G}}_{\lambda}=\left(C_{9}^{\lambda} \mp C_{10}\right) \mathcal{F}_{\lambda}-\widetilde{\boldsymbol{G}}_{\lambda}\right) \leftarrow \text { includes } C_{7}
$$

implicit dependence on $\boldsymbol{q}^{\mathbf{2}}$
$\mathcal{F}_{\lambda}, \tilde{\mathcal{G}}_{\lambda}$ new form factors that can be related to conventional form factors at a given order
An important step is to separate the real and imaginary parts of the amplitude. Three observables are non-zero only if the amplitude has an imaginary part

$$
\begin{gathered}
\mathcal{A}_{\lambda}^{L, R}=\left(C_{9}^{\lambda} \mp C_{10}\right) \mathcal{F}_{\lambda}-\widetilde{\mathcal{G}}_{\lambda}=\left(\mp C_{10}-r_{\lambda}\right) \mathcal{F}_{\lambda}+i \varepsilon_{\lambda} \\
r_{\lambda}=\frac{\operatorname{Re}\left(\widetilde{\mathcal{G}}_{\lambda}\right)}{\mathcal{F}_{\lambda}}-\operatorname{Re}\left(C_{9}^{\lambda}\right) \\
\varepsilon_{\lambda}=\operatorname{Im}\left(C_{9}^{\lambda}\right) \mathcal{F}_{\lambda}-\operatorname{Im}\left(\widetilde{\mathcal{G}}_{\lambda}\right)
\end{gathered}
$$

## 9 observables in terms of 10 parameters

$$
\left.\begin{array}{l}
F_{L} \Gamma_{f}=2 \mathcal{F}_{0}^{2}\left(r_{0}^{2}+C_{10}^{2}\right)+2 \varepsilon_{0}^{2} \\
F_{\|} \Gamma_{f}=2 \mathcal{F}_{\|}^{2}\left(r_{\|}^{2}+C_{10}^{2}\right)+2 \varepsilon_{\|}^{2} \\
F_{\perp} \Gamma_{f}=2 \mathcal{F}_{\perp}^{2}\left(r_{\perp}^{2}+C_{10}^{2}\right)+2 \varepsilon_{\perp}^{2}
\end{array}\right\} \begin{aligned}
& 2 \frac{\varepsilon_{0}^{2}}{\Gamma_{f}} \leq F_{L} \\
& 2 \frac{\varepsilon_{\|}^{2}}{\Gamma_{f}^{2}} \leq F_{\|} \\
& 2 \frac{\varepsilon_{\perp}^{2}}{\Gamma_{f}} \leq F_{\perp}
\end{aligned}
$$

$$
\sqrt{2} \pi A_{4} \Gamma_{f}=4 \mathcal{F}_{0} \mathcal{F}_{\|}\left(r_{0} r_{\|}+C_{10}^{2}\right)+4 \varepsilon_{0} \varepsilon_{\|} \quad C_{10} \text { and } \mathcal{F}_{\lambda} \text { are real in } S M
$$

$$
\sqrt{2} A_{5} \Gamma_{f}=3 \mathcal{F}_{0} \mathcal{F}_{\perp} C_{10}\left(r_{0}+r_{\perp}\right)
$$

Define new form factors

$$
A_{F B} \Gamma_{f}=3 \mathcal{F}_{\|} \mathcal{F}_{\perp} C_{10}\left(r_{\|}+r_{\perp}\right)
$$

$\mathrm{P}_{1}=\frac{\mathcal{F}_{\perp}}{\mathcal{F}_{\|}}$

$$
\sqrt{2} A_{7} \Gamma_{f}=3 C_{10}\left(\mathcal{F}_{0} \varepsilon_{\|}-\mathcal{F}_{\|} \varepsilon_{0}\right)
$$

$$
\pi A_{8} \Gamma_{f}=2 \sqrt{2}\left(\mathcal{F}_{0} r_{0} \varepsilon_{\perp}-\mathcal{F}_{\perp} r_{\perp} \varepsilon_{0}\right)
$$

$$
\mathrm{P}_{2}=\frac{\mathcal{F}_{\perp}}{\mathcal{F}_{0}}
$$

$$
\pi A_{9} \Gamma_{f}=3\left(\mathcal{F}_{\perp} r_{\perp} \varepsilon_{\|}-\mathcal{F}_{\|} r_{\|} \varepsilon_{\perp}\right)
$$

$$
\mathrm{P}_{3}=\frac{\mathcal{F}_{\perp}}{\mathcal{F}_{0}+\mathcal{F}_{\|}}=\frac{\mathrm{P}_{1} \mathrm{P}_{2}}{\mathrm{P}_{1}+\mathrm{P}_{2}}
$$

## Observables recast (last one not independent)

$$
\begin{align*}
& \boldsymbol{F}_{\|}^{\prime} \Gamma_{f}=2 \mathcal{F}_{\|}^{2}\left(r_{\|}^{2}+C_{10}^{2}\right) \\
& \boldsymbol{F}_{\perp}^{\prime} \Gamma_{f}=2 \mathcal{F}_{\perp}^{2}\left(r_{\perp}^{2}+C_{10}^{2}\right) \\
& F_{\lambda}^{\prime} \equiv F_{\lambda}-\frac{2 \varepsilon_{\lambda}^{2}}{\Gamma_{f}} \\
& \text { - } \quad F_{L}^{\prime} \Gamma_{f}=2 \mathcal{F}_{0}^{2}\left(r_{0}^{2}+C_{10}^{2}\right) \\
& \left(F_{L}^{\prime}+F_{\|}^{2}+\sqrt{2} \pi A_{4}\right) \Gamma_{f}=2\left(\mathcal{F}_{0}^{2}+\mathcal{F}_{\|}^{2}\right)\left(r_{\wedge}^{2}+C_{10}^{2}\right)  \tag{0}\\
& \text { - } \sqrt{2} A_{5} \Gamma_{f}=3 \mathcal{F}_{\perp} \mathcal{F}_{0} C_{10}\left(r_{0}+r_{\perp}\right) \\
& \text { - } A_{F B} \Gamma_{f}=3 \mathcal{F}_{\perp} \mathcal{F}_{\|} C_{10}\left(r_{\|}+r_{\perp}\right) \\
& \longrightarrow \quad \begin{array}{l}
A_{F B}=0 \\
\Rightarrow\left(r_{\|}+r_{\perp}\right)
\end{array} \\
& \left(A_{F B}+\sqrt{2} A_{5}\right) \Gamma_{f}=3 \mathcal{F}_{\perp}\left(\mathcal{F}_{\|}+\mathcal{F}_{0}\right) C_{10}\left(r_{\wedge}+r_{\perp}\right) \\
& \text { where } \quad \boldsymbol{r}_{\wedge}=\frac{\boldsymbol{r}_{\|} \mathrm{P}_{2}+\boldsymbol{r}_{\mathbf{0}} \mathrm{P}_{1}}{\mathrm{P}_{2}+\mathrm{P}_{1}} \bigcirc\left\{\begin{array}{l}
\boldsymbol{F}_{\|}^{\prime} \rightarrow \boldsymbol{F}_{L}^{\prime}, \boldsymbol{A}_{\boldsymbol{F} B} \rightarrow \sqrt{2} \boldsymbol{A}_{5} \\
\boldsymbol{F}_{\|} \rightarrow \mathcal{F}_{\mathbf{0}}
\end{array}\right.
\end{align*}
$$

- Each set solve for $r_{\perp}, C_{10}$ and $\left(r_{\|}, r_{0}, r_{\wedge}\right)$

We have derived
...hence we can write

$$
\begin{array}{rr}
r_{\|}^{2}+C_{10}^{2}=\frac{F_{\|} \Gamma_{f}}{2 \mathcal{F}_{\|}^{2}} & \frac{F_{\|} F_{\perp} \Gamma_{f}^{2}}{4 \mathcal{F}_{\|}^{2} \mathcal{F}_{\perp}^{2}}=\left(r_{\|} r_{\perp}-C_{10}\right)^{2}+C_{10}^{2}\left(r_{\|}+r_{\perp}\right)^{2} \\
r_{\perp}^{2}+C_{10}^{2}=\frac{F_{\perp} \Gamma_{f}}{2 \mathcal{F}_{\perp}^{2}} & =\left(r_{\|} r_{\perp}-C_{10}\right)^{2}+\frac{A_{\mathrm{FB}}^{2} \Gamma_{f}^{2}}{9 \mathcal{F}_{\|}^{2} \mathcal{F}_{\perp}^{2}} \\
2 C_{10}\left(r_{\|}+r_{\perp}\right)=\frac{2}{3} \frac{A_{\mathrm{FB}} \Gamma_{f}}{\mathcal{F}_{\perp} \mathcal{F}_{\|}} & r_{\|} r_{\perp}-C_{10}^{2}= \pm \frac{\Gamma_{f}}{2 \mathcal{F}_{\|} \mathcal{F}_{\perp}} \sqrt{F_{\|} F_{\perp}-\frac{4 A_{\mathrm{FB}}^{2}}{9}} \\
\text { Or } r_{\|}+r_{\perp}=\frac{ \pm \sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}}\left[\mathrm{P}_{1}^{2} F_{\|}+F_{\perp} \pm \mathrm{P}_{1} Z_{1}\right]^{1 / 2} \quad Z_{1}=\sqrt{4 F_{\|} F_{\perp}-\frac{16}{9} A_{\mathrm{FB}}^{2}}
\end{array}
$$

## One also obtains

$$
r_{\|}^{2}-r_{\perp}^{2}=\frac{F_{\|} \Gamma_{f}}{2 \mathcal{F}_{\|}^{2}}-\frac{F_{\perp} \Gamma_{f}}{2 \mathcal{F}_{\perp}^{2}} \Rightarrow r_{\|}-r_{\perp}=\frac{ \pm \sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}} \frac{\mathrm{P}_{1}^{2} F_{\|}-F_{\perp}}{\left[\mathrm{P}_{1}^{2} F_{\|}+F_{\perp} \pm \mathrm{P}_{1} Z_{1}\right]^{1 / 2}}
$$

Solve both $r_{\|}$and $r_{\perp}$

$$
\begin{array}{ll}
r_{\perp}= \pm \frac{\sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}} \frac{\left(F_{\perp}^{\prime}+\frac{1}{2} \mathrm{P}_{1} Z_{1}^{\prime}\right)}{\sqrt{\mathrm{P}_{1}^{2} F_{\|}^{\prime}+F_{\perp}^{\prime}+\mathrm{P}_{1} Z_{1}^{\prime}}} & Z_{1}^{\prime}=\sqrt{4 F_{\|}^{\prime} F_{\perp}^{\prime}-\frac{16}{9} A_{\mathrm{FB}}^{2}} \\
r_{\perp}= \pm \frac{\sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}} \frac{\left(F_{\perp}^{\prime}+\frac{1}{2} \mathrm{P}_{2} Z_{2}^{\prime}\right)}{\sqrt{\mathrm{P}_{2}^{2} F_{L}^{\prime}+F_{\perp}^{\prime}+\mathrm{P}_{2} Z_{2}^{\prime}}} & Z_{2}^{\prime}=\sqrt{4 F_{L}^{\prime} F_{\perp}^{\prime}-\frac{32}{9} A_{5}^{2}}
\end{array}
$$

$$
r_{\perp}= \pm \frac{\sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}} \frac{\left(F_{\perp}^{\prime}+\frac{1}{2} \mathrm{P}_{3} Z_{3}^{\prime}\right)}{\sqrt{\mathrm{P}_{3}^{2}\left(F_{\|}^{\prime}+F_{L}^{\prime}+\sqrt{2} \pi A_{4}^{\prime}\right)+F_{\perp}^{\prime}+\mathrm{P}_{3} Z_{3}^{\prime}}}
$$

$$
F_{\|}^{\prime} F_{\perp}^{\prime} \geq \frac{4}{9} A_{F B}^{2}
$$

$$
Z_{3}^{\prime}=\sqrt{4\left(F_{L}^{\prime}+F_{\|}^{\prime}+\sqrt{2} \pi A_{4}^{\prime}\right) F_{\perp}^{\prime}-\frac{16}{9}\left(A_{\mathrm{FB}}+\sqrt{2} A_{5}\right)^{2}}
$$

or

$$
F_{\|} F_{\perp} \geq \frac{o r}{9} A_{F B}^{2}
$$

$$
\mathrm{P}_{2}=\frac{2 \mathrm{P}_{1} A_{\mathrm{FB}} F_{\perp}^{\prime}}{s \sqrt{2} A_{5}\left(2 F_{\perp}^{\prime}+Z_{1}^{\prime} \mathrm{P}_{1}\right)-Z_{2}^{\prime} \mathrm{P}_{1} A_{\mathrm{FB}}}
$$

$\mathrm{P}_{3}=\frac{2 \mathrm{P}_{1} A_{\mathrm{FB}} F_{\perp}^{\prime}}{\left(A_{\mathrm{FB}}+\sqrt{2} A_{5}\right)\left(2 F_{\perp}^{\prime}+Z_{1}^{\prime} \mathrm{P}_{1}\right)-Z_{3}^{\prime} \mathrm{P}_{1} A_{\mathrm{FB}}}$
$\longmapsto P_{3}=\frac{P_{1} P_{2}}{P_{1}+P_{2}} \longmapsto Z_{3}^{\prime}=Z_{1}^{\prime}+Z_{2}^{\prime}$
$Z_{1}^{\prime}+Z_{2}^{\prime}=Z_{3}^{\prime}$ results in the relation
$A_{4}=\frac{2 \sqrt{2} \varepsilon_{\|} \varepsilon_{0}}{\pi \Gamma_{f}}+\frac{8 A_{5} A_{\mathrm{FB}}}{9 \pi\left(F_{\perp}-\frac{2 \varepsilon_{1}^{2}}{\Gamma_{f}}\right)}+\sqrt{2} \frac{\sqrt{\left(F_{L}-\frac{2 \varepsilon_{0}^{2}}{\Gamma_{f}}\right)\left(F_{\perp}-\frac{2 \varepsilon_{\perp}^{2}}{\Gamma_{f}}\right)-\frac{8}{9} A_{5}^{2}} \sqrt{\left(F_{\|}-\frac{2 \varepsilon_{\|}^{2}}{\Gamma_{f}}\right)\left(F_{\perp}-\frac{2 \varepsilon_{1}^{2}}{\Gamma_{f}}\right)-\frac{4}{9} A_{\mathrm{FB}}^{2}}}{\pi\left(F_{\perp}-\frac{2 \varepsilon_{\perp}^{2}}{\Gamma_{f}}\right)}$
$\varepsilon_{\lambda}$ can easily be solved in terms of $A_{7}, A_{8}, A_{9}$

$$
\begin{aligned}
& \varepsilon_{\perp}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} \mathrm{P}_{1}}{3 \sqrt{2}}+\frac{A_{8} \mathrm{P}_{2}}{4}-\frac{A_{7} \mathrm{P}_{1} \mathrm{P}_{2} r_{\perp}}{3 \pi \hat{C}_{10}}\right] \\
& \varepsilon_{\|}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} r_{0}}{3 \sqrt{2} r_{\perp}}+\frac{A_{8} \mathrm{P}_{2} r_{\|}}{4 \mathrm{P}_{1} r_{\perp}}-\frac{A_{7} \mathrm{P}_{2} r_{\|}}{3 \pi \hat{C}_{10}}\right] \\
& \varepsilon_{0}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} \mathrm{P}_{1} r_{0}}{3 \sqrt{2} \mathrm{P}_{2} r_{\perp}}+\frac{A_{8} r_{\|}}{4 r_{\perp}}-\frac{A_{7} \mathrm{P}_{1} r_{0}}{3 \pi \hat{C}_{10}}\right]
\end{aligned}
$$

Note $\frac{\varepsilon_{\lambda}}{\sqrt{\Gamma_{f}}}$ free from the form factor $\mathcal{F}_{\lambda}$ and $\Gamma_{f}$. Solutions in terms of observables and form factor ratio $\mathrm{P}_{1}$. However, solutions are iterative.

Solutions for $\frac{\varepsilon_{\lambda}}{\sqrt{\Gamma_{f}}}$ with $1 \sigma$ errors from 8 bin LHCb data

| $q^{2}$ range in $\mathrm{GeV}^{2}$ | $\varepsilon_{\perp} / \sqrt{\Gamma_{f}}$ | $\varepsilon_{\\|} / \sqrt{\Gamma_{f}}$ | $\varepsilon_{0} / \sqrt{\Gamma_{f}}$ |
| :---: | :---: | :---: | :---: |

Equation $Z_{1}^{\prime}+Z_{2}^{\prime}=Z_{3}^{\prime}$ can be used to solve for the observables $A_{4}, A_{5}, A_{F B}, F_{L}$ and $F_{\perp}$ involved in the relation

$$
\begin{aligned}
A_{4} & =\frac{8 A_{5} A_{F B}}{9 \pi F_{\perp}}+\frac{Z_{1} Z_{2}}{2 \sqrt{2} \pi F_{\perp}} \\
A_{5} & =\frac{\pi A_{4} A_{F B}}{2 F_{\|}} \pm \frac{3 Z_{1}}{8 F_{\|}} \sqrt{2 F_{\|} F_{L}-\pi^{2} A_{4}^{2}} \\
A_{F B} & =\frac{\pi A_{4} A_{5}}{2 F_{L}} \pm \frac{3 Z_{2}}{4 \sqrt{2} F_{L}} \sqrt{2 F_{\|} F_{L}-\pi^{2} A_{4}^{2}}
\end{aligned}
$$

Remember these are one and the same equation. However, sensitivity varies depending on form... At the zero crossing of $A_{F B}$ one can measure form factor
$r_{\|}+\left.r_{\perp}\right|_{A_{F B}=0}= \pm \frac{\sqrt{\Gamma_{f}}}{\sqrt{2} \mathcal{F}_{\perp}}\left(\sqrt{F}{ }_{\perp} \pm \mathrm{P}_{1} \sqrt{F_{\|}}\right)=0 \Rightarrow \mathrm{P}_{1}=-\left.\frac{\sqrt{F_{\perp}}}{\sqrt{F_{\|}}}\right|_{A_{\mathrm{FB}}=0}$

## Heavy Quark Effective Theory

## Flawor $\leftarrow \rho \rightarrow$

## Sping

Magnetic moment $\mu_{b} \sim \frac{1}{M_{b}} \Rightarrow$ spin decouples
In the heavy quark limit, $\boldsymbol{M}_{\boldsymbol{b}} \rightarrow \infty$, configration of light degrees of freedom is independent of the spin and flavor of the heavy quark.

- Heavy particle carries all the momentum
- Momentum exchange between heavy quark and light degrees of freedom is predominantly soft
- Heavy quark velocity becomes conserved quantum number Rigorous QCD $\Rightarrow$ HQET symmetries in heavy quark limit.

## Approaches to estimate hadronic...

The seven form factors $V, A_{0}, A_{1}, A_{2}, T_{1}, T_{2}$ and $T_{3}$ are calculated via non-perturbative methods like QCD sum rules on the light cone (LCSRs) when $K^{*}$ energies are large.
P. Ball and R. Zwicky, Phys. Rev. D 71, 014029 (2005) [hep-ph/0412079].

In QCD factorization (QCDF) framework, and within heavy quark and large recoil limit, all seven form factors can be written in terms of only two independent universal factors, namely, $\xi_{\|}$and $\xi_{\|}$.
J. Charles, A. Le Yaouanc, L. Oliver, O. Pene and J. C. Raynal, Phys. Rev. D 60, 014001 (1999) [hep-ph/98123587;
M. Beneke and T. Feldmann, Nucl. Phys. B 592, 3 (2001) [hep-ph/0008255];
M. Beneke, T. Feldmann and D. Seidel, Nucl. Phys. B 612, 25 (2001) [hep-ph/0106067].
M. Beneke, T. Feldmann and D. Seidel, Eur. Phys. J. C 41, 173 (2005) [hep-ph/0412400].

At leading order in $\frac{1}{m_{b}}$ and $\alpha_{s}$ the transversity amplitudes become:

$$
\begin{aligned}
A_{\perp}^{L, R} & =\sqrt{2} N m_{B}(1-\hat{s})\left[\left(C_{9}^{\text {eff }}+C_{9}^{\prime \text { eff }}\right) \mp\left(C_{10}+C_{10}^{\prime}\right)+2 \frac{\hat{m}_{b}}{\hat{s}}\left(C_{7}^{\text {eff }}+C_{7}^{\prime \text { eff }}\right)\right] \xi_{\perp}\left(E_{K^{*}}\right), \\
A_{\|}^{L, R} & =-\sqrt{2} N m_{B}(1-\hat{s})\left[\left(C_{9}^{\text {eff }}-C_{9}^{\prime e f f}\right) \mp\left(C_{10}-C_{10}^{\prime}\right)+2 \frac{\hat{m}_{b}}{\hat{s}}\left(C_{7}^{\text {eff }}-C_{7}^{\prime \text { eff }}\right)\right] \xi_{\perp}\left(E_{K^{*}}\right), \\
A_{0}^{L, R} & =-\frac{N m_{b}}{2 \hat{m}_{K^{*}} \sqrt{\hat{s}}}(1-\hat{s})^{2}\left[\left(C_{9}^{\text {eff }}-C_{9}^{\prime \text { eff }}\right) \mp\left(C_{10}-C_{10}^{\prime}\right)+2 \hat{m}_{b}\left(C_{7}^{\text {eff }}-C_{7}^{\prime \text { eff }}\right)\right] \xi_{\|}\left(E_{K^{*}}\right), \\
A_{t} & =\frac{N m_{b}}{\hat{m}_{K^{*}} \sqrt{\hat{s}}}(1-\hat{s})^{2}\left[C_{10}-C_{10}^{\prime}\right] \xi_{\|}\left(E_{K^{*}}\right)
\end{aligned}
$$

## Large recoil limit

$\mathrm{P}_{1}=\frac{\mathcal{F}_{\perp}}{\mathcal{F}_{\|}}=\frac{\sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)}}{\left(m_{B}+m_{K^{*}}\right)^{2}} \frac{V\left(q^{2}\right)}{A_{1}\left(q^{2}\right)}=\frac{-\sqrt{\lambda\left(m_{B}^{2}, m_{K^{*}}^{2}, q^{2}\right)}}{2 E_{K^{*}} m_{B}} \quad \frac{V\left(q^{2}\right)}{A_{1}\left(q^{2}\right)}=\frac{\left(m_{B}+m_{K^{*}}\right)^{2}}{2 E_{K^{K}} \cdot m_{B}}$
The transverse helicity amplitudes $\quad H_{ \pm} \propto\left(V \mp \frac{\left(m_{B}+m_{K^{*}}\right)^{2}}{2 m_{B} k_{K^{*}}} A_{1}\right)$, where $\boldsymbol{k}_{K^{*}}$ is the momentum of the $\boldsymbol{K}^{*}$. In Large Energy $\underline{\text { Limit the }}$ "+" helicity vanishes up to $\frac{m_{K^{*}}^{2}}{2 E_{K^{*}}^{2}} . E_{K^{*}}=\left(m_{B}^{2}+m_{K^{*}}^{2}-q^{2}\right) /\left(2 m_{B}\right)$.
In the HQL the decay of heavy to light quark occurs with helicity of latter inherited by the final vector meson. On the other hand the amplitude to flip the helicity of the fast outgoing light quark is suppressed by $1 / E_{K^{*}}$.Thus $\alpha_{s}$ corrections from hard gluon exchange between spectator quark and the fast light quark do not affect the ratio $\frac{V\left(q^{2}\right)}{A_{1}\left(q^{2}\right)} \quad \begin{aligned} & \text { M. Beneke and T. Feldmann, Nucl. Phys. B 592, } 3 \text { (2001) [hep-ph/0008255]; } \\ & \text { G. Burdman and G. Hiller Phys. Rev. D } 2000\end{aligned}$
$P_{1}$ is a good observable at large recoil limit unaffected by $\alpha_{s}$ order corrections - up to leading order in power corrections

## Right handed currents

In the presence of right-handed currents $\mathcal{A}_{\lambda}^{L, R}=\left(\widetilde{\boldsymbol{C}}_{\boldsymbol{9}}^{\lambda} \mp \boldsymbol{C}_{10}\right) \mathcal{F}_{\lambda}-\widetilde{\boldsymbol{G}}_{\lambda}$ becomes:

$$
\begin{array}{rr}
\mathcal{A}_{\perp}^{L, R}=\left(\left(\widetilde{\boldsymbol{C}}_{\boldsymbol{9}}^{\perp}+\boldsymbol{C}_{\mathbf{9}}^{\prime}\right) \mp\left(\boldsymbol{C}_{\mathbf{1 0}}+\boldsymbol{C}_{\mathbf{1 0}}^{\prime}\right)\right) \mathcal{F}_{\perp}-\widetilde{\boldsymbol{G}}_{\perp} & \xi=\frac{\boldsymbol{C}_{\mathbf{1 0}}^{\prime}}{C_{10}} \\
\begin{array}{rr}
\mathcal{A}_{\|, 0}^{L, R}=\left(\left(\widetilde{\boldsymbol{C}}_{9}^{\|}-\boldsymbol{C}_{\mathbf{9}}^{\prime}\right) \mp\left(\boldsymbol{C}_{\mathbf{1 0}}-\boldsymbol{C}_{\mathbf{1 0}}^{\prime}\right)\right) \mathcal{F}_{\|, \mathbf{0}}-\widetilde{\boldsymbol{G}}_{\|, 0} & \xi^{\prime}=\frac{C_{9}^{\prime}}{C_{\mathbf{1 0}}} \\
F_{\perp}=2 \zeta(1+\xi)^{2}\left(1+R_{\perp}^{2}\right) & R_{\perp}=\frac{r_{\perp} / C_{10}-\xi^{\prime}}{1+\xi} \\
F_{\|} \mathrm{P}_{1}^{2}=2 \zeta(1-\xi)^{2}\left(1+R_{\|}^{2}\right) & r_{\|} / C_{10}+\xi^{\prime} \\
F_{L} \mathrm{P}_{2}^{2}=2 \zeta(1-\xi)^{2}\left(1+R_{0}^{2}\right) & R_{\|}=\frac{1-\xi}{1-\xi} \\
A_{F B} \mathrm{P}_{1}=3 \zeta\left(1-\xi^{2}\right)\left(R_{\|}+R_{\perp}\right) & R_{0}=\frac{r_{0} / C_{10}+\xi^{\prime}}{1-\xi} \\
\sqrt{2} A_{5} \mathrm{P}_{2}=3 \zeta\left(1-\xi^{2}\right)\left(R_{0}+R_{\perp}\right) & \mathcal{F}_{\perp}^{2} C_{10}^{2} \\
\zeta=\frac{\Gamma_{f}}{} &
\end{array}
\end{array}
$$

$$
\begin{array}{ll}
R_{\perp}= \pm \frac{3}{2} \frac{\left(\frac{1-\xi}{1+\xi}\right) F_{\perp}+\frac{1}{2} P_{1} Z_{1}}{P_{1} A_{F B}} & \begin{array}{l}
\text { 4 independent observables } \\
\text { to solve for 4 parameters }
\end{array} \\
R_{\|}= \pm \frac{3}{2} \frac{\left(\frac{1+\xi}{1-\xi}\right) P_{1} F_{\|}+\frac{1}{2} Z_{1}}{A_{F B}} & \begin{array}{l}
\text { For the moment we assum } \\
\text { that the amplitudes are re } \\
\text { Simplicity of expressions. }
\end{array} \\
R_{0}= \pm \frac{3}{2 \sqrt{2} \frac{\left(\frac{1+\xi}{1-\xi}\right) P_{2} F_{L}+\frac{1}{2} Z_{2}}{A_{5}}} \begin{array}{l}
\text { Non-zero imaginary part } \\
\text { have also be included. }
\end{array} \\
P_{2}=\frac{\left(\frac{1-\xi}{1+\xi}\right) 2 P_{1} A_{F B} F_{\perp}}{\sqrt{2} A_{5}\left(\left(\frac{1-\xi}{1+\xi}\right) F_{\perp}+Z_{1} P_{1}\right)-Z_{2} P_{1} A_{F B}} \quad \begin{array}{l}
\left(\frac{1+\xi}{1-\xi}\right) P_{1} \rightarrow P_{1}
\end{array} \\
Z_{1}=\sqrt{4 F_{\|} F_{\perp}-\frac{16}{9} A_{F B}^{2}} \quad Z_{2}=\sqrt{4 F_{L} F_{\perp}-\frac{32}{9} A_{5}^{2}}
\end{array}
$$

One extra parameter hence expressions depend on $\mathrm{P}_{1}$

At $q^{2}=q_{\text {max }}^{2}=\left(m_{B}-m_{K^{*}}\right)^{2}$ the $K^{*}$ meson is at rest and the two leptons travel back to back in the $B$ meson rest frame. There is no preferred direction in the decay kinematics. Hence, the differential decay distribution in this kinematic limit must be independent of the angles $\theta_{\ell}$ and $\phi$.

- The entire decay, including the decay $K^{*} \rightarrow K \pi$ takes place in a plane resulting in a vanishing contribution to the " $\perp$ " helicity or $F_{\perp}=0$.
- Since the $K^{*}$ decays at rest, the distribution of $K^{*}$ is isotropic and cannot depend on $\theta_{K}$. It can easily be seen that this is only possible if $F_{\|}=2 F_{L}$.
At $q^{2}=q_{\max }^{2}, \Gamma_{f} \rightarrow 0$ as all the transversity amplitudes vanish in this limit. The constraints on the amplitudes result in unique values of the helicity fractions and the asymmetries at this kinematical endpoint. $\quad F_{L}\left(q_{\text {max }}^{2}\right)=\frac{1}{3} \quad F_{\|}\left(q_{\text {max }}^{2}\right)=\frac{2}{3} \quad F_{\perp}\left(q_{\text {max }}^{2}\right)=0 \quad$ Hiller, Ziwchy ' 14

$$
A_{F B}\left(q_{\text {max }}^{2}\right)=0=\mathrm{A}_{5,7,8,9}\left(q_{\text {max }}^{2}\right) \quad \mathrm{A}_{4}\left(q_{\text {max }}^{2}\right)=\frac{2}{3 \pi}
$$

The large $q^{2}$ region where the $K^{*}$ has low-recoil energy has been studied in a modified heavy quark effective theory framework. In the limit $q^{2} \rightarrow q_{\text {max }}^{2}$ the hadronic form factors satisfy the conditions

$$
\frac{\tilde{G}_{\perp}}{\mathcal{F}_{\perp}}=\frac{\tilde{G}_{\|}}{\mathcal{F}_{\|}}=\frac{\tilde{G}_{0}}{\mathcal{F}_{0}}=-\kappa \frac{2 m_{b} m_{B} C_{7}^{\text {C. Bobeth, G. Hiller and D.van }}}{q^{2}} \Rightarrow r_{\perp}=r_{\|}=r_{0} \equiv r
$$

Thus only in the presence of right handed currents can one expect

$$
R_{0}=R_{\|} \neq R_{\perp}
$$

We study the values of $R_{\lambda}, \zeta$ and $P_{1,2}$ in the large $q^{2}$ region and consider the kinematic limit $q^{2} \rightarrow \boldsymbol{q}_{\text {max }}^{2}$.
$F_{\perp}\left(q_{\text {max }}^{2}\right)=0 \Rightarrow \zeta=0$ at $\boldsymbol{q}^{2} \rightarrow \boldsymbol{q}_{\text {max }}^{2}$
$R_{\|}\left(\boldsymbol{q}_{\text {max }}^{\mathbf{2}}\right)=R_{0}\left(\boldsymbol{q}_{\text {max }}^{\mathbf{2}}\right) \Rightarrow \mathrm{P}_{2}=\sqrt{2} \mathrm{P}_{1}$ at $\boldsymbol{q}^{\mathbf{2}} \rightarrow \boldsymbol{q}_{\text {max }}^{\mathbf{2}}$
Both $\mathrm{P}_{1}$ and $\mathrm{P}_{2}$ go to zero at $q_{\max }^{2}$. Hence take into account limiting values very carefully.

Taylor expand all observables around the endpoint $\boldsymbol{q}_{\text {max }}^{2}$ in terms of the variable $\delta \equiv \boldsymbol{q}_{\max }^{2}-q^{2}$. Leading power of $\delta$ in the Taylor expansion must take into account relative momentum dependence of amplitudes $\mathcal{A}_{\lambda}^{L, R}$

$$
\begin{aligned}
F_{L} & =\frac{1}{3}+F_{L}^{(1)} \delta+F_{L}^{(2)} \delta^{2}+F_{L}^{(3)} \delta^{3} \\
F_{\perp} & =F_{\perp}^{(1)} \delta+F_{\perp}^{(2)} \delta^{2}+F_{\perp}^{(3)} \delta^{3} \\
A_{F B} & =A_{F B}^{(1)} \delta^{1 / 2}+A_{F B}^{(2)} \delta^{3 / 2}+A_{F B}^{(3)} \delta^{5 / 2} \\
A_{5} & =A_{5}^{(1)} \delta^{1 / 2}+A_{5}^{(2)} \delta^{3 / 2}+A_{5}^{(3)} \delta^{5 / 2}
\end{aligned}
$$

Unfortunately, very bad approximation in the strict sense. However, works reasonably well. Resonances cannot be accommodated in a Taylor expansion and there exist resonances. Experimental binned measurements include resonance contributions. We calculate these errors as systematics.

Compare form-factor generated binned data without resonances with similar data generated using resonances observed in $B$ $\rightarrow K \ell \ell$. Discrepancy will be a rough guide to errors because of resonances. Full study under way.

Taylor expansion of form factors:

$$
q^{2} \frac{\tilde{\mathcal{G}}_{\lambda}}{\mathcal{F}_{\lambda}}=q_{\max }^{2} \frac{\tilde{\mathcal{G}}_{\lambda}^{(1)}+\delta\left(\tilde{\mathcal{G}}_{\lambda}^{(2)}-\frac{\tilde{\mathcal{G}}_{\lambda}^{(1)}}{q_{\max }^{2}}\right)+\mathcal{O}\left(\delta^{2}\right)}{\mathcal{F}_{\lambda}^{(1)}+\delta \mathcal{F}_{\lambda}^{(2)}+\mathcal{O}\left(\delta^{2}\right)}
$$

Assume that relation is valid up to order $\delta$

$$
\begin{gathered}
\Rightarrow \mathcal{F}_{\lambda}^{(1)}=c \mathcal{F}_{\lambda}^{(2)} \text { and } \\
\left(q_{\max }^{2} \mathcal{G}_{\lambda}^{(2)}-\mathcal{G}_{\lambda}^{(1)}\right)=c q_{\max }^{2} \mathcal{G}_{\lambda}^{(1)} \\
\Rightarrow \mathrm{P}_{2}^{(1)}=\sqrt{2} \mathrm{P}_{1}^{(1)} \text { and } \mathrm{P}_{2}^{(2)}=\sqrt{2} \mathrm{P}_{1}^{(2)}
\end{gathered}
$$

The expressions for $R_{\lambda}$ in the limit $q^{2} \rightarrow q_{\text {max }}^{2}$ are

$$
\begin{align*}
R_{\perp}\left(q_{\max }^{2}\right) & =\frac{8 A_{\mathrm{FB}}^{(1)}\left(-2 A_{5}^{(2)}+A_{\mathrm{FB}}^{(2)}\right)+9\left(3 F_{L}^{(1)}+F_{\perp}^{(1)}\right) F_{\perp}^{(1)}}{8\left(2 A_{5}^{(2)}-A_{\mathrm{FB}}^{(2)}\right) \sqrt{\frac{3}{2} F_{\perp}^{(1)}-A_{\mathrm{FB}}^{(1) 2}}} \\
& =\frac{\omega_{2}-\omega_{1}}{\omega_{2} \sqrt{\omega_{1}-1}},  \tag{30}\\
R_{\|}\left(q_{\max }^{2}\right) & =\frac{3\left(3 F_{L}^{(1)}+F_{\perp}^{(1)}\right) \sqrt{\frac{3}{2} F_{\perp}^{(1)}-A_{\mathrm{FB}}^{(1) 2}}}{-8 A_{5}^{(2)}+4 A_{\mathrm{FB}}^{(1)}+3 A_{\mathrm{FB}}^{(1)}\left(3 F_{L}^{(1)}+F_{\perp}^{(1)}\right)} \\
& =\frac{\sqrt{\omega_{1}-1}}{\omega_{2}-1}=R_{0}\left(q_{\max }^{2}\right)  \tag{31}\\
\omega_{1}= & \frac{3}{2} \frac{F_{\perp}^{(1)}}{A_{\mathrm{FB}}^{(1) 2}} \text { and } \omega_{2}=\frac{4\left(2 A_{5}^{(2)}-A_{\mathrm{FB}}^{(2)}\right)}{3 A_{\mathrm{FB}}^{(1)}\left(3 F_{L}^{(1)}+F_{\perp}^{(1)}\right)} .
\end{align*}
$$

## Including the imaginary part

$\varepsilon_{\perp}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} \mathrm{P}_{1}}{3 \sqrt{2}}+\frac{A_{8} \mathrm{P}_{2}}{4}-\frac{A_{7} \mathrm{P}_{1} \mathrm{P}_{2} r_{\perp}}{3 \pi \hat{C}_{10}}\right]$
$\varepsilon_{\|}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} r_{0}}{3 \sqrt{2} r_{\perp}}+\frac{A_{8} \mathrm{P}_{2} r_{\|}}{4 \mathrm{P}_{1} r_{\perp}}-\frac{A_{7} \mathrm{P}_{2} r_{\|}}{3 \pi \hat{C}_{10}}\right]$
$\varepsilon_{0}=\frac{\sqrt{2} \pi \Gamma_{f}}{\left(r_{0}-r_{\|}\right) \mathcal{F}_{\perp}}\left[\frac{A_{9} \mathrm{P}_{1} r_{0}}{3 \sqrt{2} \mathrm{P}_{2} r_{\perp}}+\frac{A_{8} r_{\|}}{4 r_{\perp}}-\frac{A_{7} \mathrm{P}_{1} r_{0}}{3 \pi \hat{C}_{10}}\right]$
$\varepsilon_{\lambda}$ can easily be solved in terms of $A_{7}, A_{8}, A_{9}$. Note $\frac{\varepsilon_{\lambda}}{\sqrt{\Gamma_{f}}}$ free from the form factor $\mathcal{F}_{\lambda}$ and $\Gamma_{f}$. It leads to a modification of the expressions for $\omega_{1}$ and $\omega_{2}$

$$
\begin{aligned}
& \widehat{\varepsilon}_{\perp}=\widehat{\varepsilon}_{\perp}^{(1)} \delta+\widehat{\varepsilon}_{\perp}^{(2)} \delta^{2}+\widehat{\varepsilon}_{\perp}^{(3)} \delta^{3} \\
& \widehat{\varepsilon}_{0}=\widehat{\varepsilon}_{0}^{(0)}+\widehat{\varepsilon}_{0}^{(1)} \delta+\widehat{\varepsilon}_{0}^{(2)} \delta^{2} \\
& \widehat{\varepsilon}_{\|}=\widehat{\varepsilon}_{\|}^{(0)}+\widehat{\varepsilon}_{\|}^{(1)} \delta+\widehat{\varepsilon}_{\|}^{(2)} \delta^{2} \\
& \hat{\epsilon}_{\lambda} \equiv 2 \frac{\epsilon_{\lambda}^{2}}{\Gamma_{f}} \quad \hat{\epsilon}_{\|}^{(0)}=2 \hat{\epsilon}_{0}^{(0)}
\end{aligned}
$$

$$
\begin{aligned}
& \omega_{1}=\frac{9}{4} \frac{\left(\frac{2}{3}-2 \widehat{\varepsilon}_{0}^{(0)}\right)\left(F_{\perp}^{(1)}-\widehat{\varepsilon}_{\perp}^{(1)}\right)}{A_{\mathrm{FB}}^{(1) 2}} \\
& \omega_{2}=\frac{4\left(2 A_{5}^{(2)}-A_{\mathrm{FB}}^{(2)}\right)\left(1-3 \widehat{\varepsilon}_{0}^{(0)}\right)}{3 A_{\mathrm{FB}}^{(1)}\left(3 F_{L}^{(1)}+F_{\perp}^{(1)}+\widehat{\varepsilon}_{\|}^{(1)}-2 \widehat{\varepsilon}_{0}^{(1)}\right)}
\end{aligned}
$$

|  | $O^{(1)}\left(10^{-2}\right)$ | $O^{(2)}\left(10^{-3}\right)$ | $O^{(3)}\left(10^{-4}\right)$ |
| :---: | :---: | :---: | :---: |
| $F_{L}$ | $-2.94 \pm 1.36$ | $12.27 \pm 2.05$ | $-5.73 \pm 0.72$ |
| $F_{\perp}$ | $6.83 \pm 1.75$ | $-9.67 \pm 2.59$ | $3.77 \pm 0.90$ |
| $A_{\mathrm{FB}}$ | $-30.59 \pm 2.37$ | $26.75 \pm 4.42$ | $-4.00 \pm 1.83$ |
| $A_{5}$ | $-16.57 \pm 2.36$ | $6.77 \pm 4.18$ | $1.94 \pm 1.61$ |

## Conclusions

1. The $B \rightarrow K^{*} \ell^{+} \ell^{-}$is an excellent mode to study. Sensitive to $N P$ and hints seen.
2. Theoretical issues are well understood. Resonances effects are still remain to be understood.
3. Non-local contributions are difficult to estimate but can be handled by eliminating them in terms of observables.
4. More effort should be put to estimate them. One should look for experimental hints to estimate how large they are.

## THANK YOU

[^0]:    M. Beneke and T. Feldmann, Nucl. Phys. B 592 (2001) 3
